

Science of Science Research and Tools

Tutorial #08 of 12

Dr. Katy Börner

Cyberinfrastructure for Network Science Center, Director
Information Visualization Laboratory, Director
School of Library and Information Science
Indiana University, Bloomington, IN
<http://info.slis.indiana.edu/~katy>

With special thanks to Kevin W. Boyack, Micah Linnemeier,
Russell J. Duhon, Patrick Phillips, Joseph Biberstine, Chintan Tank
Nianli Ma, Hanning Guo, Mark A. Price, Angela M. Zoss, and
Scott Weingart

Invited by Robin M. Wagner, Ph.D., M.S.
Chief Reporting Branch, Division of Information Services
Office of Research Information Systems, Office of Extramural Research
Office of the Director, National Institutes of Health

Suite 4090, 6705 Rockledge Drive, Bethesda, MD 20892
10a-noon, July 20, 2010

12 Tutorials in 12 Days at NIH—Overview

1. Science of Science Research **1st Week**
2. Information Visualization
3. CIShell Powered Tools: Network Workbench and Science of Science Tool

4. Temporal Analysis—Burst Detection **2nd Week**
5. Geospatial Analysis and Mapping
6. Topical Analysis & Mapping

7. Tree Analysis and Visualization **3rd Week**
8. Network Analysis
9. Large Network Analysis

10. Using the Scholarly Database at IU **4th Week**
11. VIVO National Researcher Networking
12. Future Developments

12 Tutorials in 12 Days at NIH—Overview

[#08] Network Analysis and Visualization

- General Overview
- Designing Effective Network Visualizations
- Notions and Notations
- Sci2-Reading and Extracting Networks
- Sci2-Analysing Networks
- Sci2-Visualizing Networks
- Outlook
- Exercise: Identify Promising Network Analyses of NIH Data

[#08] Network Analysis and Visualization

- General Overview
- Designing Effective Network Visualizations
- Notions and Notations
- Sci2-Reading and Extracting Networks
- Sci2-Analysing Networks
- Sci2-Visualizing Networks
- Outlook
- Exercise: Identify Promising Network Analyses of NIH Data

4

Sample Networks

- Communication networks
 - Internet, telephone network, wireless network.
- Network applications
 - The World Wide Web, Email interactions
- Transportation network/ Road maps
- Relationships between objects in a data base
 - Function/module dependency graphs
 - Knowledge bases

Network Properties

- Directed vs. undirected
- Weighted vs. unweighted
- Additional node and edge attributes
- One vs. multiple node & edge types
- Network type (random, small world, scale free, hierarchical networks)

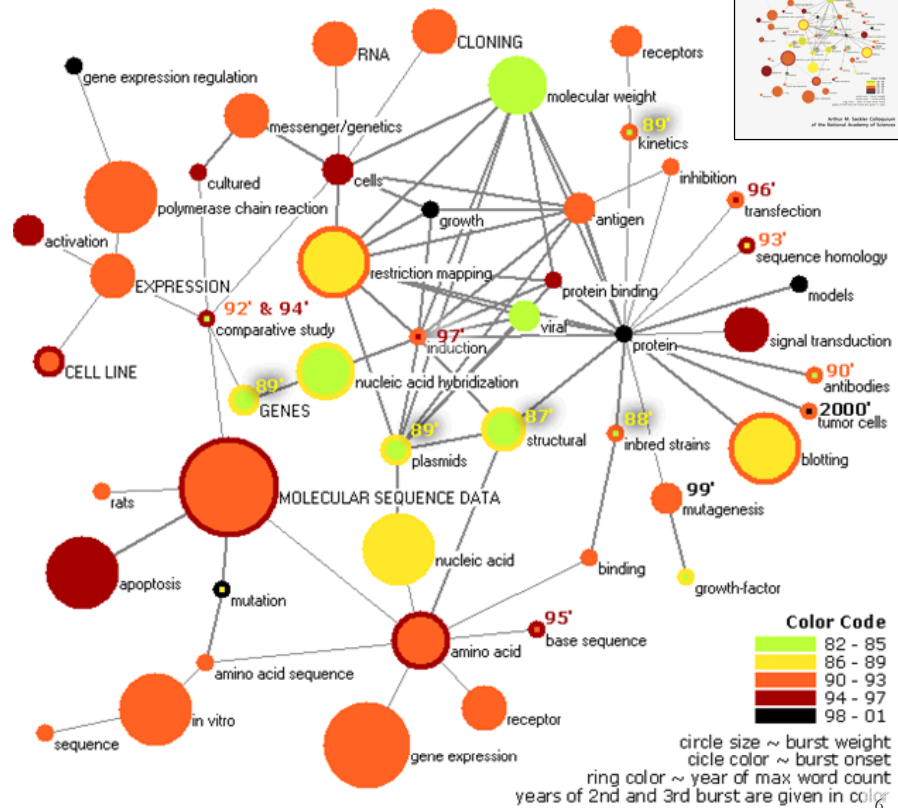

Information Visualization Course, Katy Börner, Indiana University

5

Reducing the number of edges via pathfinder network scaling.

Co-word space of the top 50 highly frequent and bursty words used in the top 10% most highly cited PNAS publications in 1982-2001.

Force Directed Layout – How does it work?

The algorithm simulates a system of forces defined on an input graph and outputs a locally minimum energy configuration. Nodes resemble mass points repelling each other and the edges simulate springs with attracting forces. The algorithm tries to minimize the energy of this physical system of mass particles.

Required are

- A force model
- Technique for finding locally minimum energy configurations.

P. Eades, "A heuristic for graph drawing"
Congressus Numerantium, 42,149-160,1984.

Force Directed Layout cont.

Force Models

Force Model	Formula	Example of usage
Spring Force	$F = k(1-a)$ <i>k- stiffness of spring</i> <i>a- natural length of spring</i>	Assigning different k and a to different edges to separate nodes by different distances.
Gravity Force	$F = g/r^2$ <i>g- associated with mass of node,</i> <i>usually equals 1.</i>	Apply gravity force between node pairs to prevent node overlapping.
Electrical and Magnetic Force	$F = eE$ $F = qB$ <i>E- electric field strength</i> <i>B- magnetic field strength</i>	Changes nodes distribution along a direction.

A simple algorithm to find the equilibrium configuration is to trace the move of each node according to Newton's 2nd law. This takes time $O(n^3)$, which makes it unsuitable for large data sets. [Rob Forbes \(1987\)](#) proposed two methods that were able to accelerate convergence of a FDP problem 3-4 times. One stabilizes the derivative of the repulsion force and the other uses information on node movement and instability characteristics to make a predictive extrapolation.

9

Force Directed Layout cont.

Most existing algorithms extend Eades' algorithm (1984) by providing methods for the intelligent initial placement of nodes, clustering the data to perform an initial coarse layout followed by successively more detailed placement, and grid-based systems for dividing up the dataset.

GEM (Graph EMbedder) attempts to recognize and forestall non-productive rotation and oscillation in the motion of nodes in the graph as it cools, see *Frick, A., A. Ludwig and H. Mehlman (1994). A fast adaptive layout algorithm for undirected graphs. Graph Drawing, Springer-Verlag: 388-403.*

Walshaw's (2000) multilevel algorithm provides a "divide and conquer" method for laying out very large graphs by using clustering, see *Walshaw, C. (2000). A multilevel algorithm for force-directed graph drawing. 8th International Symposium Graph Drawing, Springer-Verlag: 171-182.*

10

Force Directed Layout cont.

VxOrd (Davidson, Wylie et al. 2001) uses a density grid in place of pair-wise repulsive forces to speed up execution and achieves computation times order $O(N)$ rather than $O(N^2)$. It also employs barrier jumping to avoid trapping of clusters in local minima.

Davidson, G. S., B. N. Wylie and K. W. Boyack (2001). "Cluster stability and the use of noise in interpretation of clustering." Proc. IEEE Information Visualization 2001: 23-30.

An extremely fast layout algorithm for visualizing large-scale networks in three-dimensional space was proposed by (Han and Ju 2003).

Han, K. and B.-H. Ju (2003). "A fast layout algorithm for protein interaction networks." Bioinformatics 19(15): 1882-1888.

Today, the algorithm developed by Kamada and Kawai (Kamada and Kawai 1989) and Fruchterman and Reingold (Fruchterman and Reingold 1991) are most commonly used, partially because they are available in Pajek.

Fruchterman, T. M. J. and E. M. Reingold (1991). "Graph Drawing by Force-Directed Placement." Software-Practice & Experience 21(11): 1129-1164.

Kamada, T. and S. Kawai (1989). "An algorithm for drawing general undirected graphs." Information Processing Letters 31(1): 7-15.

Börner, Katy, Sanyal, Soma and Vespignani, Alessandro (2007). Network Science. In Blaise Cronin (Ed.), ARIST, Information Today, Inc./American Society for Information Science and Technology, Medford, NJ, Volume 41, Chapter 12, pp. 537-607. <http://ivl.slis.indiana.edu/km/pub/2007-borner-arist.pdf>

Notions and Notations

Figure 2: Adjacency matrix and graph presentations of different undirected and directed graphs.

Börner, Katy, Sanyal, Soma and Vespignani, Alessandro (2007). Network Science. In Blaise Cronin (Ed.), ARIST, Information Today, Inc./American Society for Information Science and Technology, Medford, NJ, Volume 41, Chapter 12, pp. 537-607. <http://ivl.slis.indiana.edu/km/pub/2007-borner-arist.pdf>

Notions and Notations

2.2.1 Node Degree

In undirected graphs, the degree k of a node is termed the number of edges connected to it. In directed graphs, the degree of a node is defined by the sum of its in-degree and its out-degree, $k_i = k_{in,i} + k_{out,i}$, where the *in-degree* $k_{in,i}$ of the node i is defined as the number of edges pointing to i ; its *out-degree* $k_{out,i}$ is defined as the number of edges departing from i . In terms of the adjacency matrix, we can write

$$k_{in,i} = \sum_j A_{ji}, \quad k_{out,i} = \sum_j A_{ij}. \quad (1)$$

For an undirected graph, with a symmetric adjacency matrix, $k_{in,i} = k_{out,i} \equiv k_i$ holds. For example, node 1 in Figure 2a has a degree of three. Node 1 in Figure 2e has an in-degree of two and an out-degree of one.

2.2.2 Nearest Neighbors

The nearest neighbors of a node i are the nodes to which it is connected directly by an edge, so the number of nearest neighbors of the node is equal to the node degree. For example, node 1 in Figure 2a has nodes 0, 2, and 3 as nearest neighbors.

2.2.3 Path

A path P_{i_0, i_n} that connects the nodes i_0 and i_n in a graph $G = (V, E)$ is defined as an ordered collection of $n+1$ nodes $V_P = \{i_0, i_1, \dots, i_n\}$ and n edges $E_P = \{(i_0, i_1), (i_1, i_2), \dots, (i_{n-1}, i_n)\}$, such that $i_\alpha \in V$ and $(i_{\alpha-1}, i_\alpha) \in E$, for all α . The *length* of the path P_{i_0, i_n} is n . For example, the path in Figure 2f that interconnects nodes 0, 1, and 2 has a length of two.

Börner, Katy, Sanyal, Soma and Vespignani, Alessandro (2007). Network Science. In Blaise Cronin (Ed.), ARIST, Information Today, Inc./American Society for Information Science and Technology, Medford, NJ, Volume 41, Chapter 12, pp. 537-607. <http://ivl.slis.indiana.edu/km/pub/2007-borner-arist.pdf>

15

Notions and Notations

Betweenness centrality is a measure that aims to describe a node's position in a network in terms of the flow it is able to control. As an example, consider two highly connected subgraphs that share one node but no other nodes or edges. Here, the shared node controls the flow of information, for example, rumors in a social network. Any path from any node in one subgraph to any node in the other subgraph leads through the shared node. The shared node has a rather high betweenness centrality. Mathematically, the betweenness centrality is defined as the number of shortest paths between pairs of nodes that pass through a given node (Freeman, 1977). More precisely, let $L_{h,j}$ be the total number of shortest paths from h to j and $L_{h,i,j}$ be the number of those shortest paths that pass through the node i . The betweenness b of node i is then defined as $b_i = \sum L_{h,i,j} / L_{h,j}$, where the sum runs over all h,j pairs with $j \neq h$. An efficient algorithm

to compute betweenness centrality was reported by Brandes (2001). The betweenness centrality is often used in transportation networks to provide an estimate of the traffic handled by different nodes, assuming that the frequency of use can be approximated by the number of shortest paths passing through a given node. It is important to stress that while the betweenness centrality is a local attribute of any given node, it is calculated by looking at all paths among all nodes in the network and therefore it is a measure of the node centrality with respect to the global topology of the network.

Börner, Katy, Sanyal, Soma and Vespignani, Alessandro (2007). Network Science. In Blaise Cronin (Ed.), ARIST, Information Today, Inc./American Society for Information Science and Technology, Medford, NJ, Volume 41, Chapter 12, pp. 537-607. <http://ivl.slis.indiana.edu/km/pub/2007-borner-arist.pdf>

Network Extraction - Examples

Sample paper network (left) and four different network types derived from it (right).
From ISI files, about 30 different networks can be extracted.

Papers A-E written by authors x, y, z over 3 years.
Each paper happens to have 4 references.

Paper-Paper Citation Network

Papers are connected via direct citation links. Arrows represent information flow from older papers to younger papers.

Author-Author (Co-Author) Network

x and y co-author papers A and E together
y and z co-author papers A and E

Document Co-Citation (DCA) Network

A and B are co-cited by C and D
A and D are co-cited by E

Reference Co-Occurrence (Bibliographic Coupling) Network

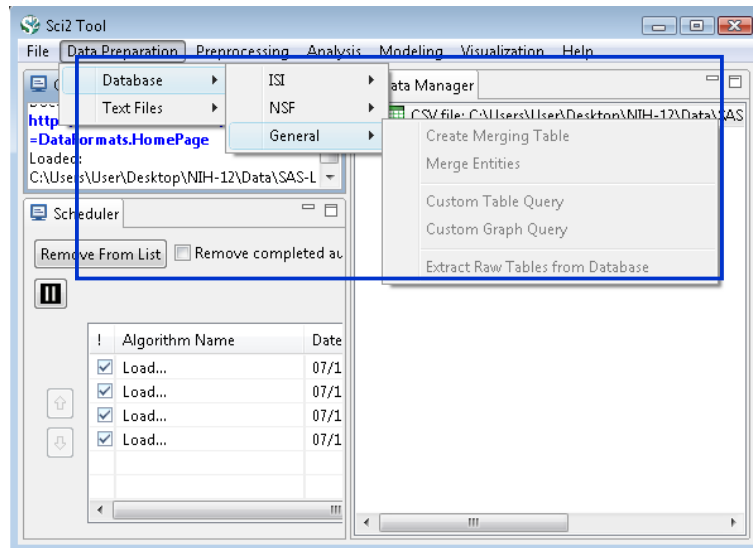

C and D are bibliographically coupled as they both cite/reference A and B.

Local citation counts (within this dataset) are given in **black** and global citation counts (ISI times cited) are given in **green** above each paper.

Network Visualization

General Visualization Objectives

- Representing structural information & content information
- Efficient space utilization
- Easy comprehension
- Aesthetics
- Support of interactive exploration

Challenges in Visualizing Large Networks

- Positioning nodes without overlap
- De-cluttering links
- Labeling
- Navigation/interaction

General Network Representations

Matrices

1	0	0	6	0
0	10.5	0	0	0
0	0	.015	0	0

Network layouts of nodes and links

29

Aesthetic Criteria for Network Visualization

- Symmetric.
- Evenly distributed nodes.
- Uniform edge lengths.
- Minimized edge crossings.
- Orthogonal drawings.
- Minimize area / bends / slopes / angles

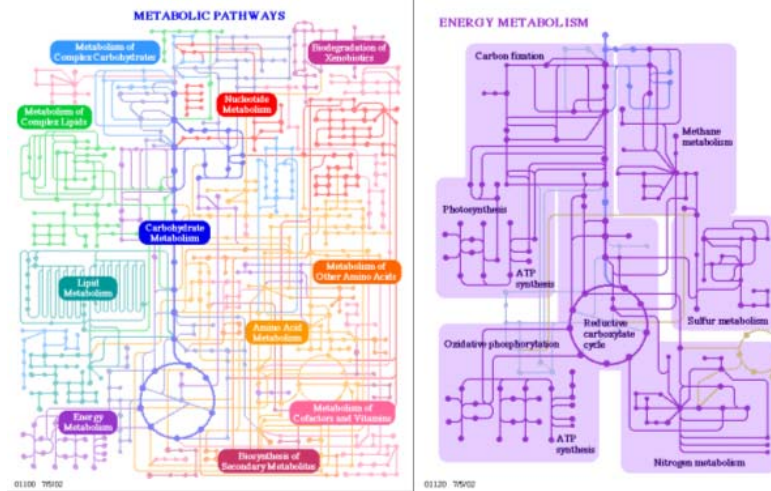

Optimization criteria may be relaxed to speed up layout process.

(Source: Fruchterman & R. alg p. 76, see Table & discussion Hearst, p 88)

30

Aesthetic Network Visualization

<http://www.genome.ad.jp/kegg/pathway/map/map01100.html>

31

Small Networks

- Up to 100 nodes
- All nodes and edges and most of their attributes can be shown.

General mappings for

nodes

- # -> (area) size
- Intensity (secondary value) -> color
- Type -> shape

edges

- # -> thickness
- Intensity, age, etc. -> color
- Type -> style

32

Medium Size Networks

- Up to 10,000 nodes
- Most nodes can be shown but not all their labels.
- Frequently, the number of edges and attributes need to be reduced.

Major design strategies:

Show only important nodes, edges, labels, attributes

Order nodes spatially

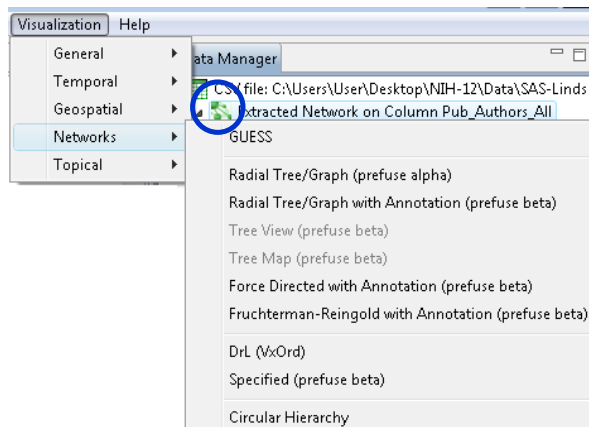

Reduce number of displayed nodes

33

Visualize Networks with Sci2 Tool

See *Science of Science (Sci2) Tool User Manual, Version Alpha 3, Section 3.1* for a listing and brief explanations of all plugins. http://sci.slis.indiana.edu/registration/docs/Sci2_Tutorial.pdf

Visualize multidisciplinary nature of work with reference to PIs and ICs within a portfolio by Geetha Senthil (PAGroup)

Please see [Sci2-Tutorial-Geetha-Senthil.pdf](#)

Sci² Tool Tutorial

Multidisciplinary nature of work with reference to PIs and ICs within a portfolio

Author: [Geetha Senthil \(PAGroup\)](#)

User: IC

Target/Lead: Who is conducting multidisciplinary projects?

Data: NIH grant data in csv format

Analysis: Directed network analysis

Workflow:

- Load the data as standard csv file with columns for performing unit (e.g., IC, PI, institution) and topic terms (e.g., RDCD terms).

	A	B
1	PI Name	Topic Terms
2	J. Smith	Brain; Cancer
3		

- Extract binomial network using Data Preparation > Text Files > Extract Directed Network with four Column "performing unit", Target Column "topic terms", and Text Delimiter (e.g., |).
 - Get topics in network tables by running Analysis > Network > Network Analysis Toolkit.
 - If there are too many nodes, narrow down components by running Analysis > Network > Largest and Directed > Most Component Cluster.
 - If there are too many isolated (unconnected) nodes, run Processing > Network > Detect Isolated. Select the only small network in Data Manager and visualize in GUESS.
 - In the directed binomial network, arrows run from performing unit to topic term(s). The *indeg* (number of arrows pointing to a node) and *outdeg* (number of arrows originating at a node) can be used to classify the node type. Colorize the nodes in *g* mode by running Analysis > Network > Largest and Directed > Color Indeg and outdeg > Network > Largest and Directed > Color Classifier.
 - To view the network, select the (largest component of the) network in Data Manager and visualize in GUESS. Use Layout > GUESS and pack nodes into available display space using Layout > BinPack.
 - To color code the nodes by institution, IC/PI, and RDCD, select the option in the information window for "node based on", then select "indeg" and the "Value" that you would like to be displayed. Use the color option to color code IC/PI. To color RDCD, select "Node size" option and "outdeg" option followed by specifying a range of values and color to classify the cast genes.

Sci² Tool Tutorial

Fig 1: Directed Network of IC versus RDCD cast genes for a particular portfolio. Red circles indicate the ICs and the blue circles are for RDCD cast genes. The size of the red circles indicates the number of cast genes (outdeg) for that IC.

Fig 2: Directed Network of PI and RDCD cast genes for a particular portfolio to understand multidisciplinary nature of their work. Red circles indicate the PIs and the blue circles are for RDCD cast genes. The larger the size of the red circles, the more multidisciplinary the project are.

[#08] Network Analysis and Visualization

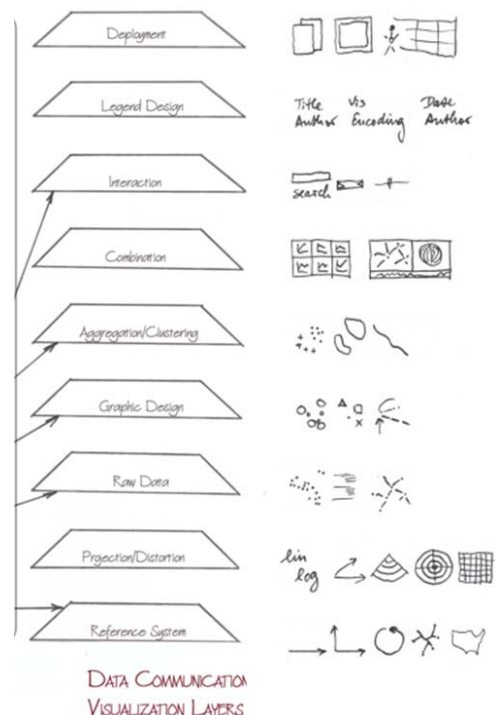

- General Overview
- Designing Effective Network Visualizations
- Notions and Notations
- Sci2-Reading and Extracting Networks
- Sci2-Analysing Networks
- Sci2-Visualizing Networks
- Outlook
- Exercise: Identify Promising Network Analyses of NIH Data

43

Outlook – Visualization Layers See [Tutorial #02](#)

- **Deployment** of results is enabled through paper printouts, online animations, or interactive, three-dimensional, audiovisual environments.
- The **Legend Design** delivers guidance on the purpose, generation, and visual encoding of the data. Mapmakers should proudly sign their visualizations, adding credibility as well as contact information.
- In many cases, it is desirable to **Interact** with the data, that is, to zoom, pan, filter, search, and request details on demand. Selecting a data entity in one view might highlight this entity in other views.
- Sometimes it is beneficial to show multiple simultaneous views of the data, here referred to as **Combination**.
- Frequently, **Aggregation/Clustering** techniques are applied to identify data entities with common attribute values or dense connectivity patterns.
- **Graphic Design** refers to the visual encoding of data attributes using qualities such as size, color, and shape coding of nodes, linkages, or surface areas.
- Placing the **Raw Data** in a reference system reveals spatial patterns.
- **Projections/Distortions** of the reference system help emphasize certain areas or provide focus and context.
- **Reference Systems** organize the space.

44

Outlook - OSGi/CIShell Adoption

See **Tutorial #03**

A number of other projects recently adopted OSGi, among them are:

Cytoscape (<http://www.cytoscape.org>) lead by Trey Ideker, UCSD is an open source bioinformatics software platform for visualizing molecular interaction networks and integrating these interactions with gene expression profiles and other state data (Shannon et al., 2002).

TEXTrend (<http://www.textrend.org>) lead by George Kampis, Eötvös University, Hungary develops a framework for the easy and flexible integration, configuration, and extension of plugin-based components in support of natural language processing (NLP), classification/mining, and graph algorithms for the analysis of business and governmental text corpuses with an inherently temporal component.

As the functionality of OSGi-based software frameworks improves and the number and diversity of dataset and algorithm plugins increases, the capabilities of custom tools will expand.

Run **Cytoscape** out of Sci2 Tool by adding `org.textrend.visualization.cytoscape_0.0.3.jar` to the `/plugin` directory.

Soon, general 'star database' will be available. NIH database is planned.

[#08] Network Analysis and Visualization

- General Overview
- Designing Effective Network Visualizations
- Notions and Notations
- Sci2-Reading and Extracting Networks
- Sci2-Analysing Networks
- Sci2-Visualizing Networks
- Outlook
- Exercise: Identify Promising Network Analyses of NIH Data

46

Exercise

Please identify a promising network analysis of NIH data.

Document it by listing

- Project title
- User, i.e., who would be most interested in the result?
- Insight need addressed, i.e., what would you/user like to understand?
- Data used, be as specific as possible.
- Analysis algorithms used.
- Visualization generated. Please make a sketch with legend.
