VII.10
History of Science Fiction, by Ward Shelley

BROOKLYN, NY 2011
Courtesy of Ward Shelley Studios

Ward Shelley is an artist identified with the Williamsburg scene in Brooklyn, New York. This map plots the science fiction literary genre from its nascent beginnings in the late 18th century, emerging out of the data, here the narrative structure precedes and organizes the data. The map's structure is like a tree whose tentacles are like trace roots to pre-historical sources and whose body is the genre itself. The map is a Romanticism, which birthed gothic fiction, source not only of Sci-Fi, but also of critical theory. The map progressed through a number of distinct periods, which are charted, citing hundreds of authors and works.

Modeling and Visualizing Science and Technology Developments

December 4-5, 2017; Irvine, CA

Organized by Katy Börner, H. Eugene Stanley, William Rouse and Paul Trunfio

Overview

This colloquium was held in Irvine, CA on December 4-5, 2017.

This colloquium brought together researchers and practitioners from multiple disciplines to present, discuss, and advance computational models and visualizations of science and technology (S&T). Existing computational models are being applied by academia, government, and industry to explore questions such as: What jobs will exist in ten years and what career paths lead to success? Which types of institutions will likely be most innovative in the future? How will the higher education cost bubble burst affect these institutions? What funding strategies have the highest return on investment? How will changing demographics, alternative economic growth trajectories, and relationships among nations impact answers to these and other questions? Large-scale datasets (e.g., publications, patents, funding, clinical trials, stock market, social media data) can now be utilized to simulate the structure and evolution of S&T. Advances in computational power have created the possibility of implementing scalable, empirically validated computational models. However, because the databases are massive and multidimensional, both the data and the models tend to exceed human comprehension. How can advances in data visualizations be effectively employed to communicate the data, the models, and the model results to diverse stakeholder groups? Who will be the users of next generation models and visualizations and what decisions will they be addressing.

Videos of the talks are available on the [Sackler YouTube Channel](#).

Data Visualization Literacy: Definitions, Conceptual Frameworks, Exercises, and Assessments

Katy Börner¹, Andreas Bueckle¹, Michael Ginda¹

¹Indiana University

Submitted to Proceedings of the National Academy of Sciences of the United States of America

In the information age, the ability to read and construct data visualizations becomes as important as the ability to read and write text. However, while standard definitions and theoretical frameworks to teach and assess textual, mathematical, and visual literacy exist, current data visualization literacy (DVL) definitions and frameworks are not comprehensive enough to guide the design of DVL teaching and assessment. This paper introduces a conceptual framework (DVL-FW) that was specifically developed to define, teach, and assess DVL. The holistic DVL-FW promotes both the *reading and construction* of data visualizations, a pairing analogous to that of both *reading and writing* in textual literacy and *understanding and applying* in mathematical literacy. Specifically, the DVL-FW defines a hierarchical typology of core concepts and details the process steps that are required to extract insights from data. Advancing the state of the art, the DVL-FW interlinks theoretical and procedural knowledge and showcases how both can be combined to design curricula and assessment measures for DVL. Earlier versions of the DVL-FW have been used to teach DVL to more than 8,500 residential and online students, and results from this effort have helped revise and validate the DVL-FW presented here.

Data visualization | literacy | assessment | learning sciences

measurement, and estimation,” as well as an “understanding of ratio concepts, notably fractions, proportions, percentages, and probabilities” (6). PISA defines it as “an individual’s capacity to formulate, employ, and interpret mathematics in a variety of contexts,” including “reasoning mathematically and using mathematical concepts, procedures, facts and tools to describe, explain and predict phenomena.” PISA administers standardized tests for math, problem-solving, and financial literacy (7). The *PISA 2015 Draft Mathematics Framework* (8) explains the *theoretical underpinnings* of the assessment, the formal *definition* of mathematical literacy, the mathematical *processes* which students undertake when using mathematical literacy, and the fundamental mathematical *capabilities* that underlie those processes.

Visual literacy was initially defined as a person’s ability to “discriminate and interpret the visible actions, objects, and symbols natural or man-made, that he encounters in his environment” (9). In 1978, it was defined “as a group of skills which enable an individual to understand and use visuals for intentionally communicating with others” (10). More recently, the Association of College and Research Libraries (ACRL) defined standards, performance indicators, and learning outcomes for visual literacy (11, 12). In the academic setting, Avgerinou (13) developed and validated a visual literacy index by running focus groups of visual

Understanding complex networked systems is key to solving some of the most vexing problems confronting humankind, from discovering how dynamic brain connections give rise to thoughts and behaviors, to detecting and preventing the spread of misinformation or unhealthy behaviors across a population. Graduate training, however, typically occurs in one of two dimensions: experimental and observational methods in a specific area such as biology and sociology, or in general methodologies such as machine learning and data science.
