## MODEL OVERVIEW GRAPH

## LAYERED DISTRIBUTIONS

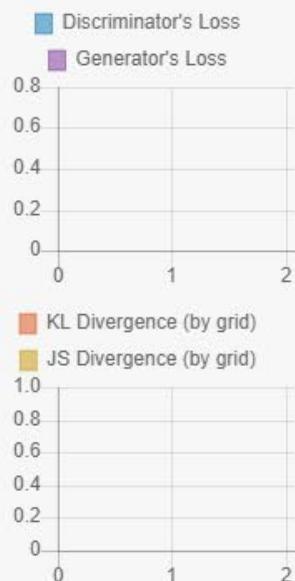

Each dot is a 2D data sample: [real samples](#); [fake samples](#).

Background colors of grid cells represent [discriminator](#)'s classifications.  
Samples in [green regions](#) are likely to be real; those in [purple regions](#) likely fake.

**Manifold** represents [generator](#)'s transformation results from noise space.  
Opacity encodes density: darker purple means more samples in smaller area.

Pink lines from fake samples represent [gradients](#) for generator.  
↗ This sample needs to move upper right to decrease generator's loss.

## METRICS

input (32x32x3)

max activation: 0.42156, min: -0.45295  
max gradient: 0.07001, min: -0.03894

# Data Visualization Literacy Framework

Börner, Katy, Andreas Bueckle, and Michael Ginda. 2019. Data visualization literacy: Definitions, conceptual frameworks, exercises, and assessments. *PNAS*, 116 (6) 1857-1864.

# Data Visualization Literacy (DVL)

Data visualization literacy (ability to read, make, and explain data visualizations) requires:

- literacy (ability to read and write text in titles, axis labels, legends, etc.),
- visual literacy (ability to find, interpret, evaluate, use, and create images and visual media), and
- mathematical literacy (ability to formulate, employ, and interpret math in a variety of contexts).

Being able to “read and write” data visualizations is becoming as important as being able to read and write text. Understanding, measuring, and improving data and visualization literacy is important to strategically approach local and global issues.

# DVL Framework: Desirable Properties

- Most existing frameworks focus on **READING**. We believe that much expertise is gained from also **CONSTRUCTING** data visualizations.
- Reading and constructing data visualizations needs to take human perception and cognition into account.
- Frameworks should build on and consolidate prior work in cartography, psychology, cognitive science, statistics, scientific visualization, data visualization, learning sciences, etc. in support of a de facto standard.
- Theoretically grounded + practically useful + easy to learn/use.
- Highly modular and extendable.

# DVL Framework: Development Process

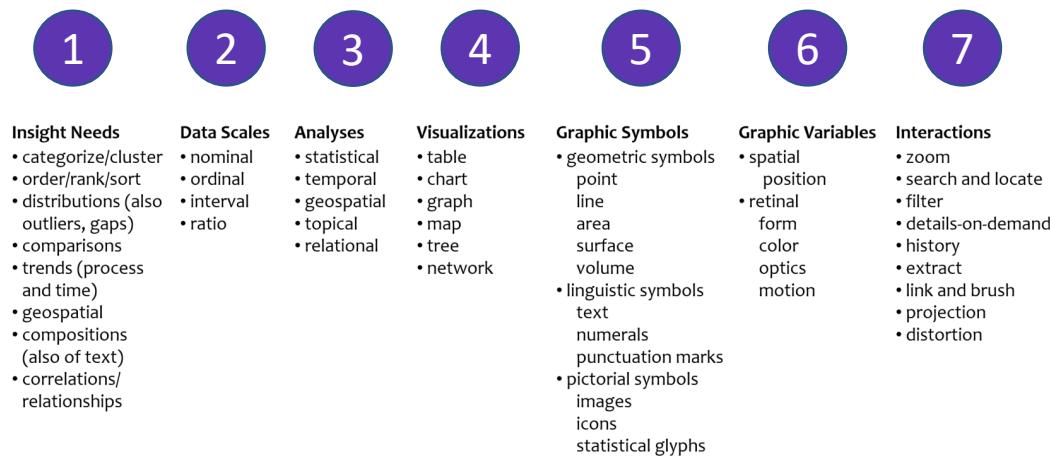

- The initial DVL-FW was developed via an extensive literature review.
- The resulting DVL-FW typology, process model, exercises, and assessments were then tested in the *Information Visualization* course taught for more than 17 years at Indiana University. More than 8,500 students enrolled in the IVMOOC version (<http://ivmooc.cns.iu.edu>) over the last six years.
- The FW was further refined using feedback gained from constructing and interpreting data visualizations for 100+ real-world client projects.
- Data on student engagement, performance, and feedback guided the continuous improvement of the DVL-FW typology, process model, and exercises for defining, teaching, and assessing DVL.
- The DVL-FW used in this course supports the systematic construction and interpretation of data visualizations.

# Data Visualization Literacy Framework (DVL-FW)

Consists of two parts:

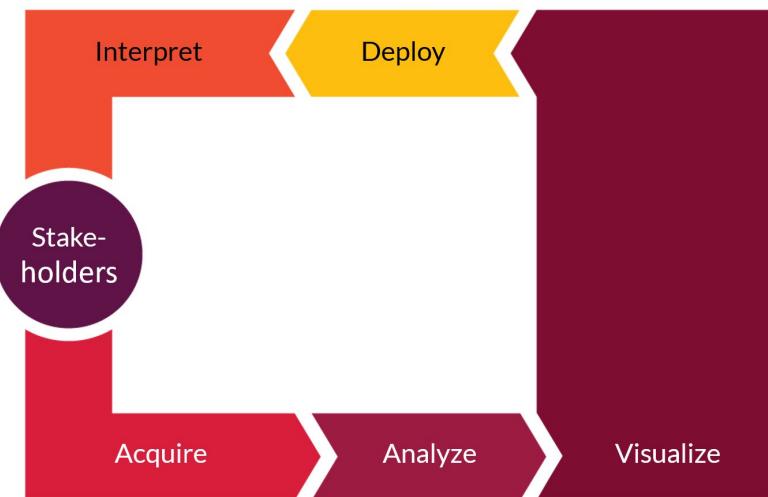

## DVL Typology

Defines 7 types with 4-17 members each.

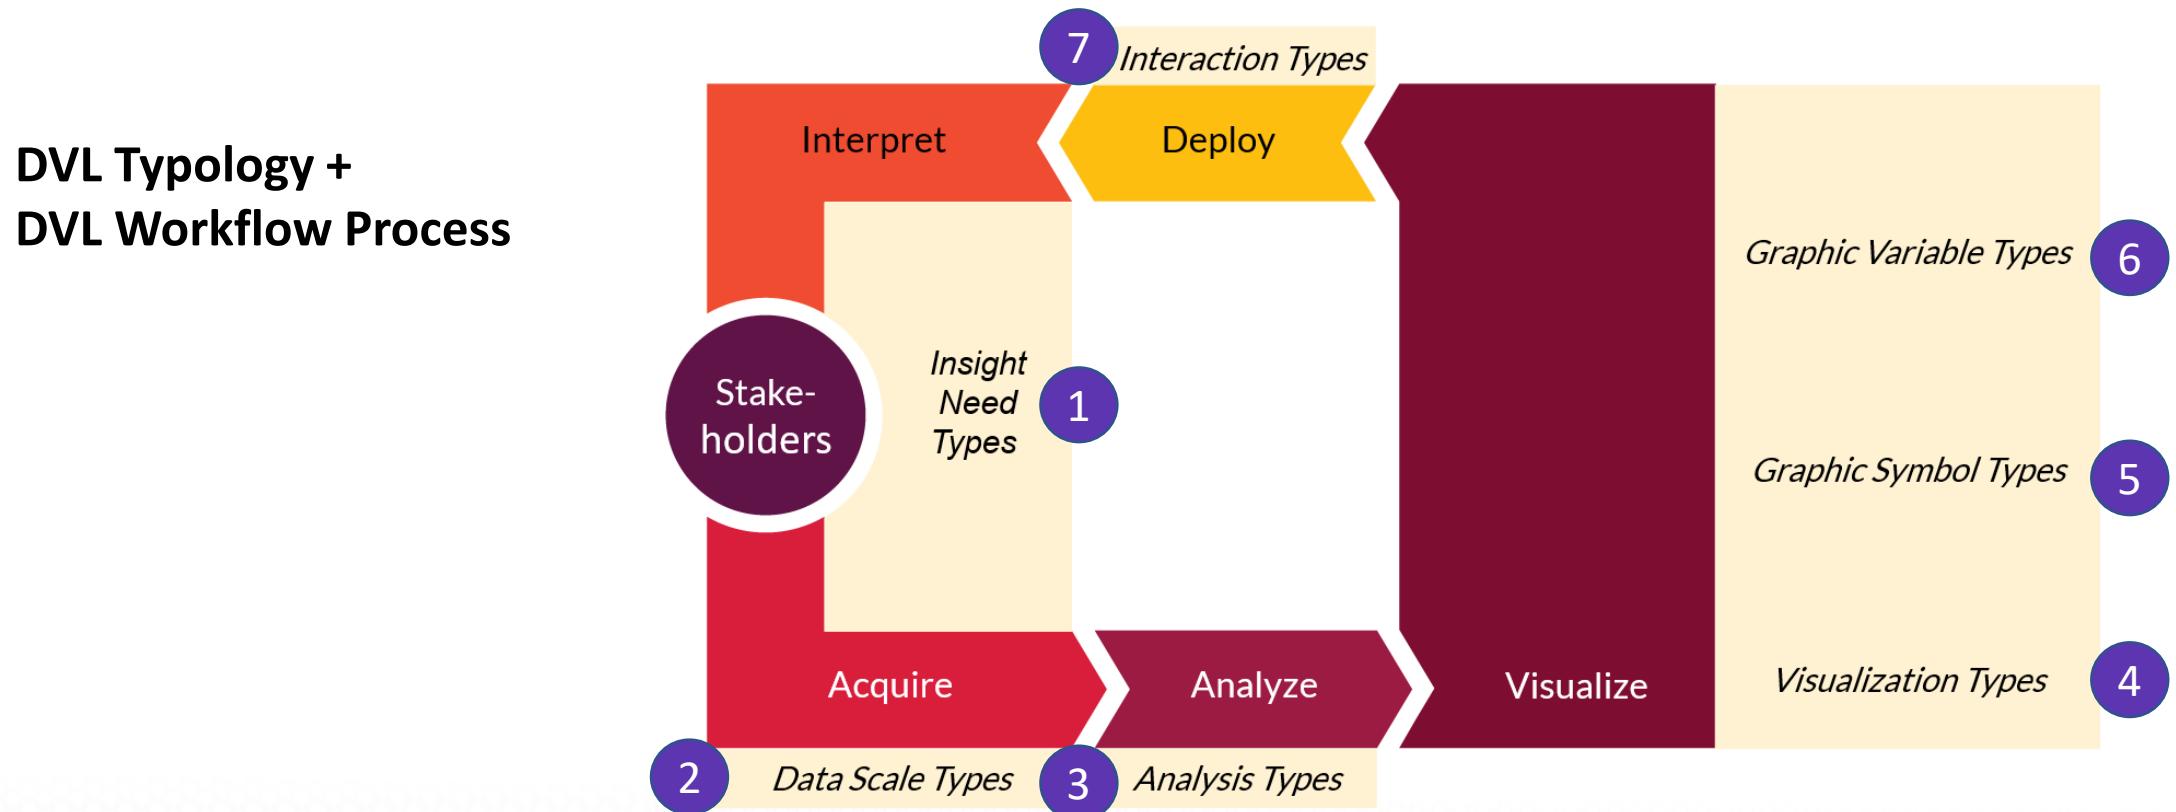

## DVL Workflow Process

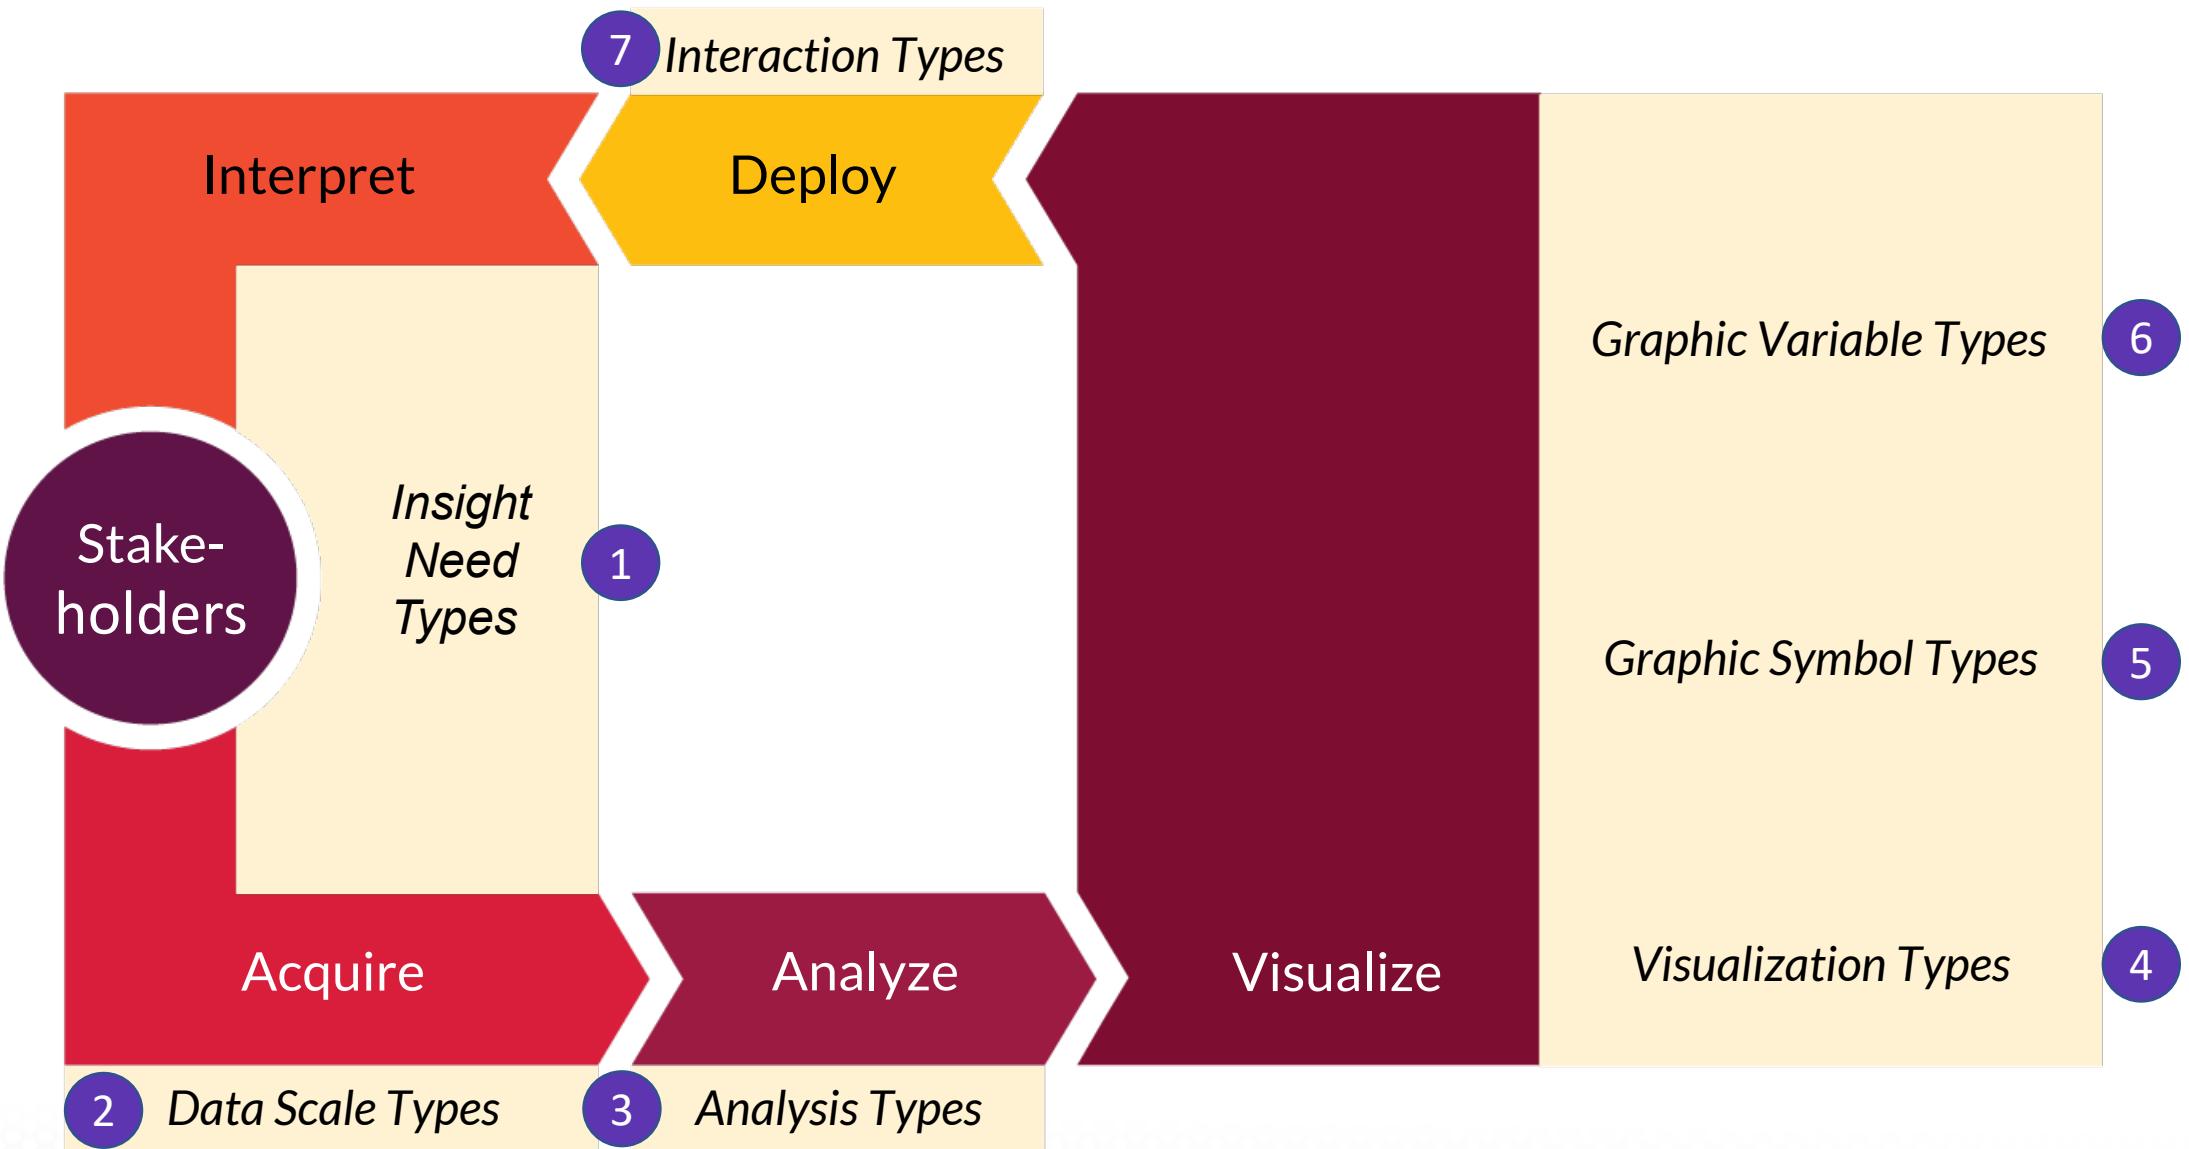

Defines 5 steps required to render data into insights.

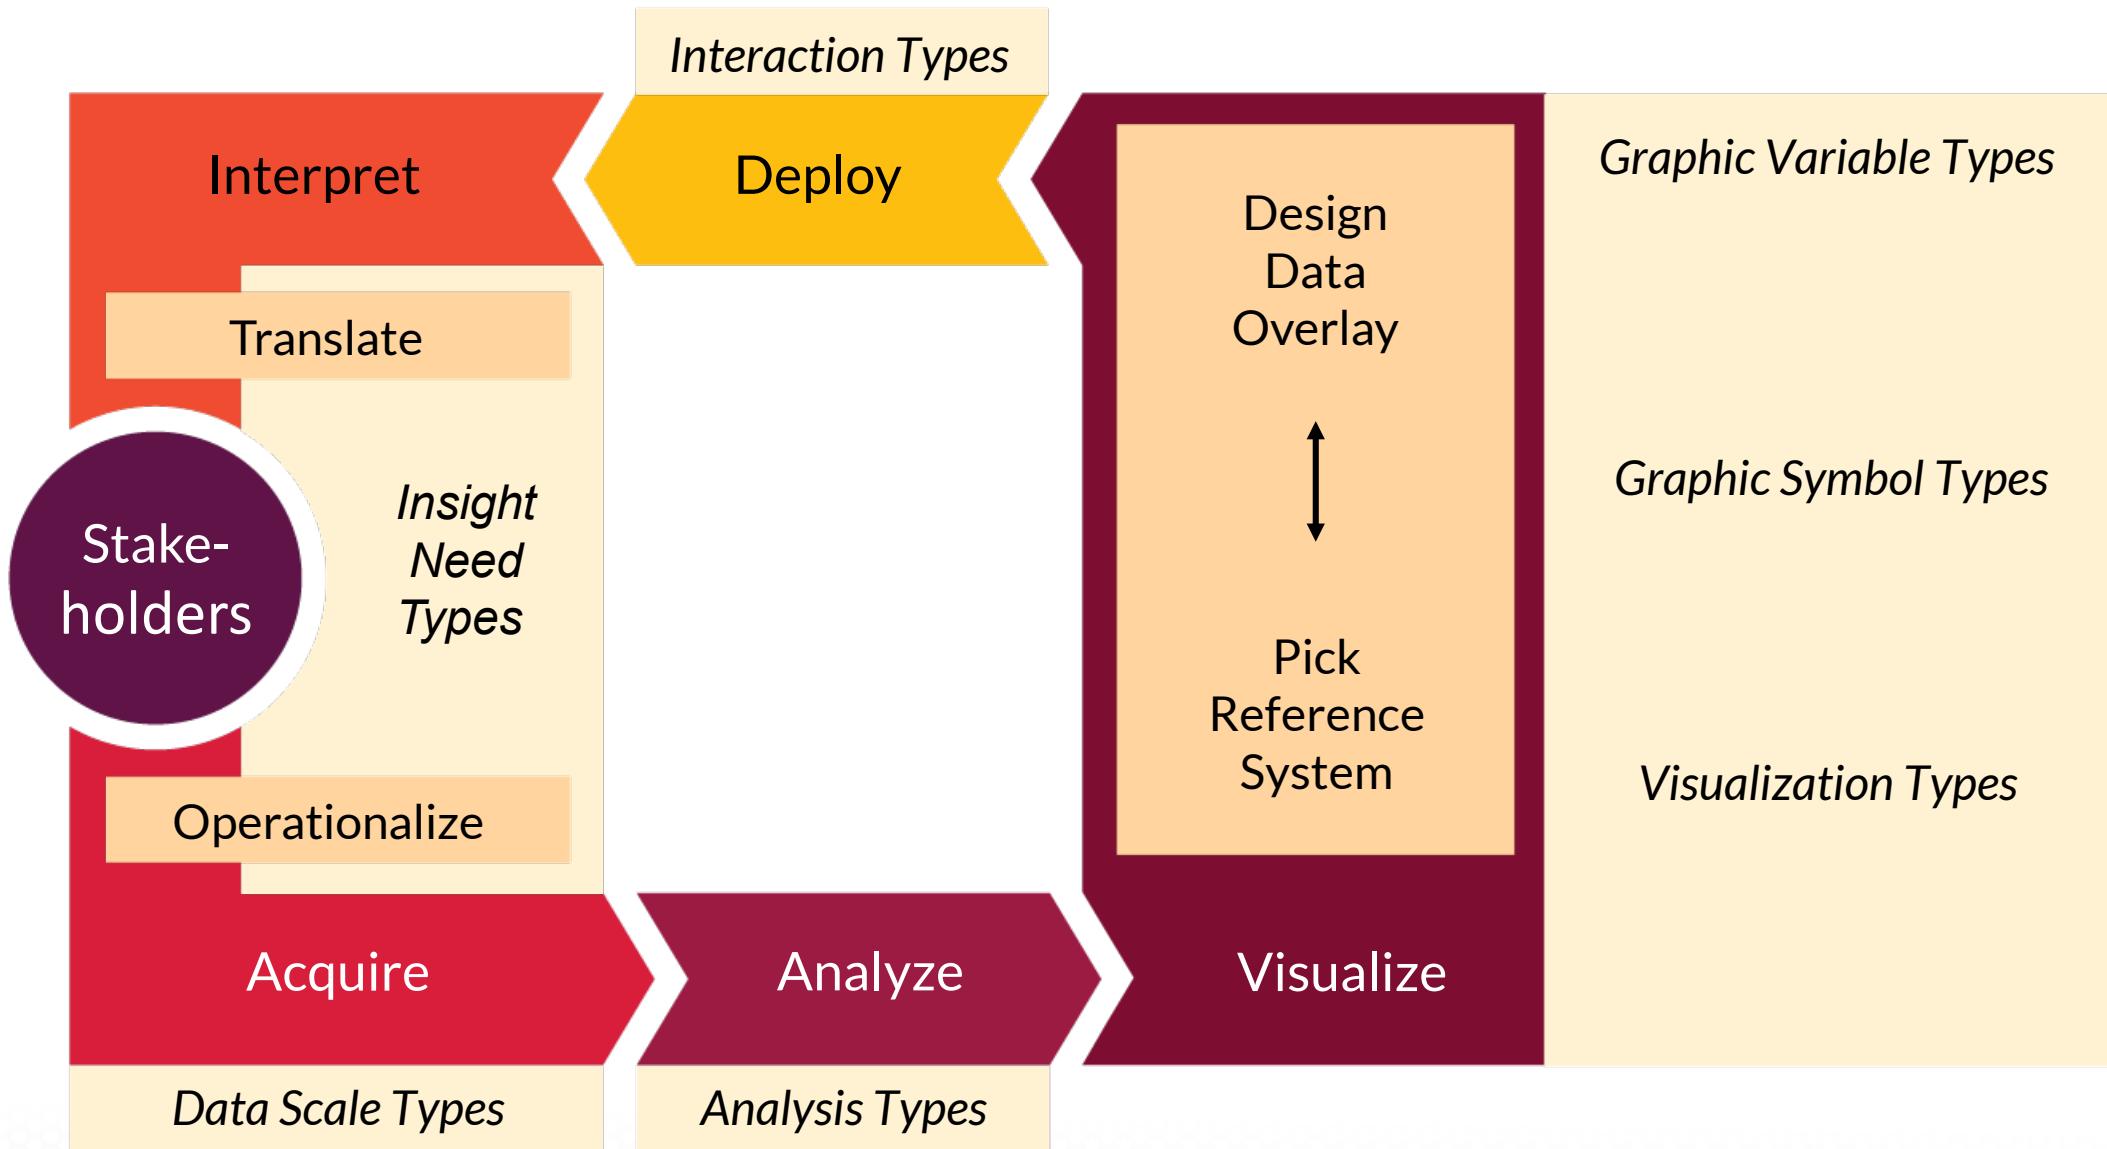

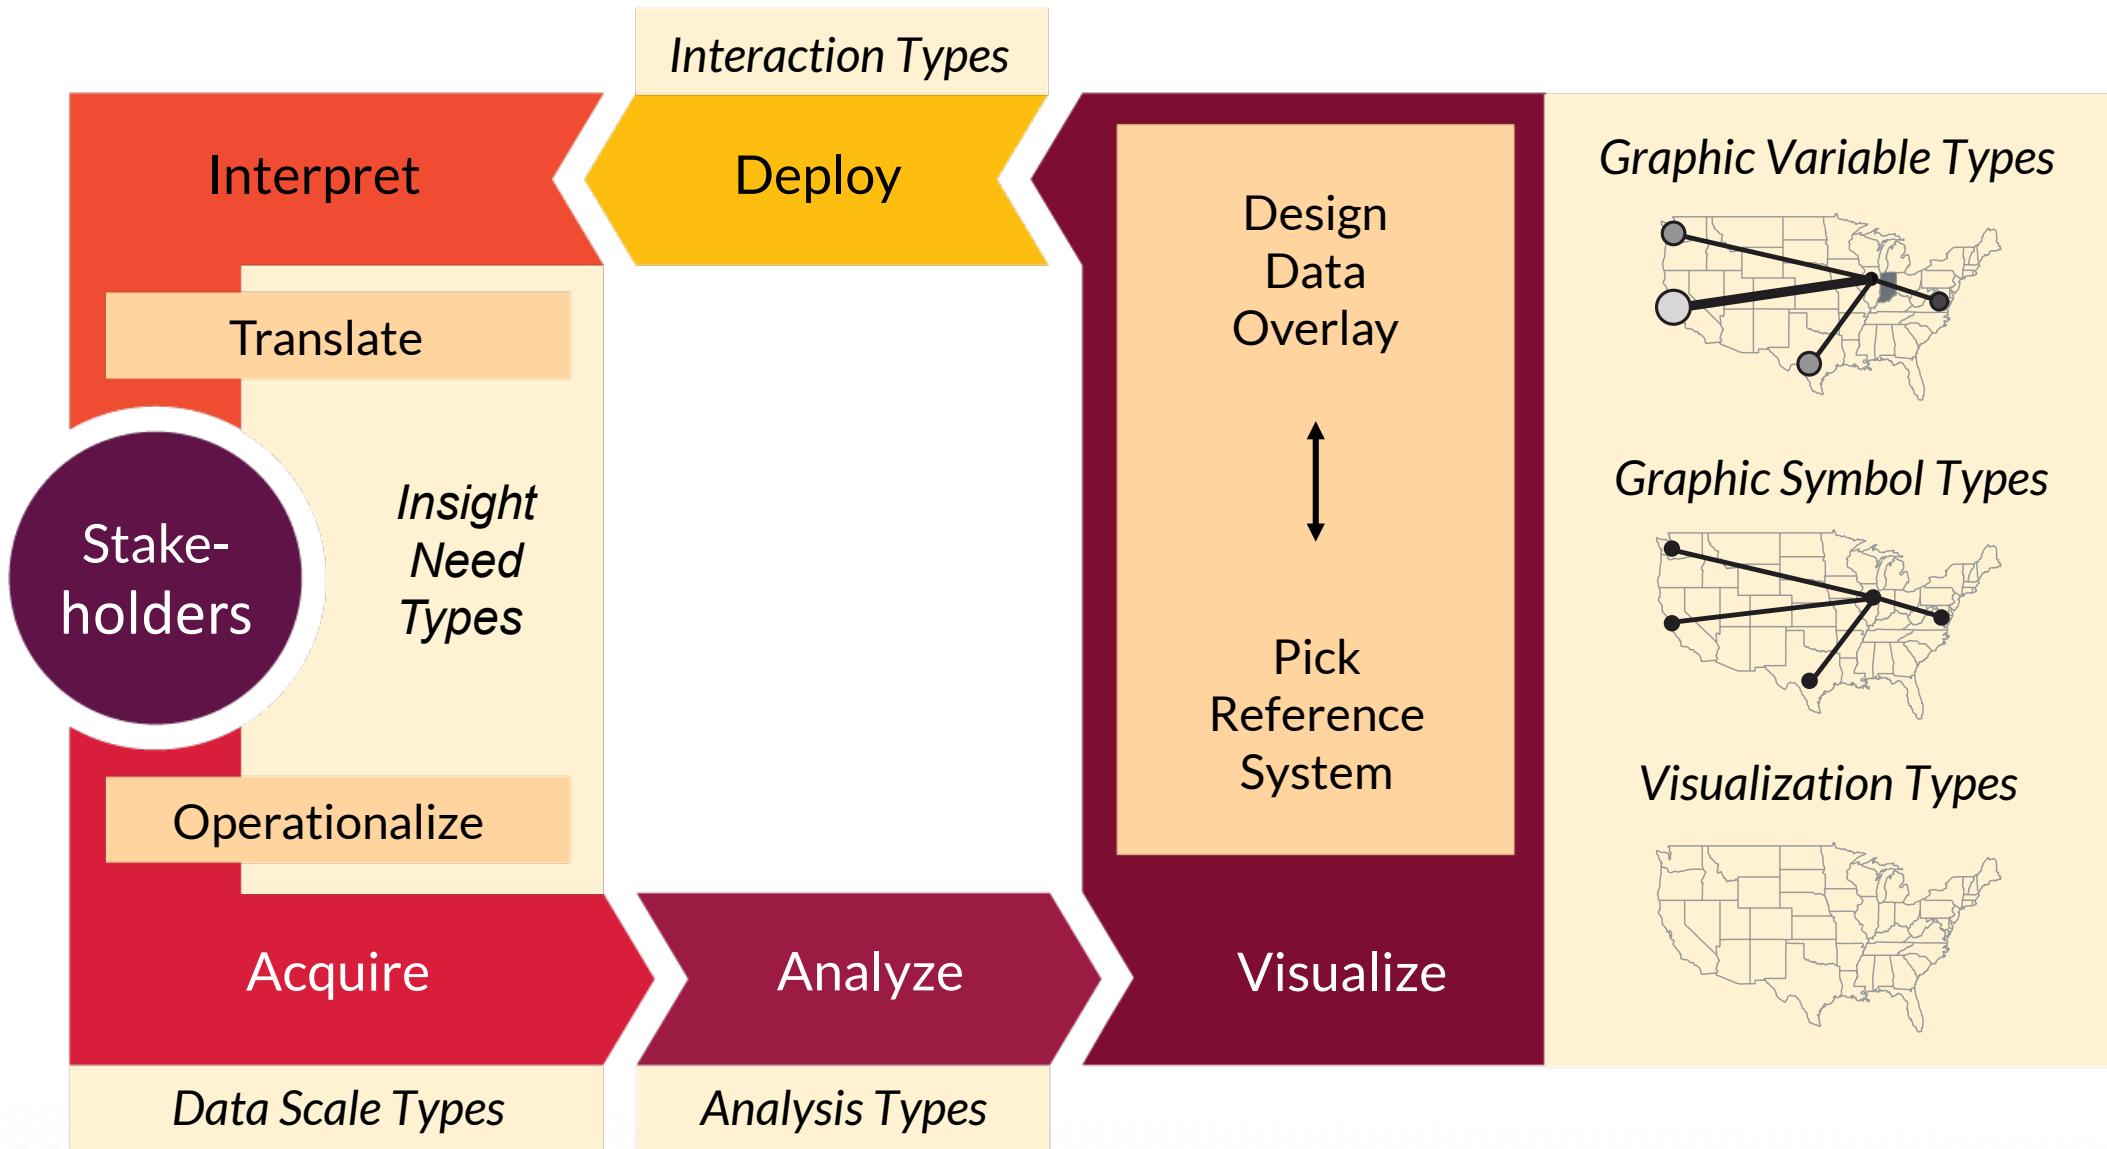

# Data Visualization Literacy Framework (DVL-FW)

Consists of two parts **that are interlinked**:

# Data Visualization Literacy Framework (DVL-FW)

Implemented in Make-A-Vis (MAV) to support learning via horizontal transfer, scaffolding, hands-on learning, etc.

The screenshot illustrates the Make-A-Vis (MAV) interface, which is designed to support learning through horizontal transfer, scaffolding, and hands-on learning. The interface is divided into three main sections:

- Data Section:** Displays two datasets: "ISI Publications" (CSV Preprocessed-wos) and "Journals" (from ISI Publications). The "ISI Publications" dataset includes columns for Title, Authors, Journal, Year, and #Cites, with a total of 562 records. The "Journals" dataset includes columns for Name, #Papers, #Cites, First Year, and Last Year, with a total of 562 records. A purple circle with the number 4 is positioned above the "ISI Publications" section.
- Make Visualization Section:** A central panel titled "Select Visualization Type" offers four options: Scatter Graph, Temporal Bar Graph, Geomap, and Scimap. The "Temporal Bar Graph" option is selected and highlighted with a blue background. Below this, there are dropdown menus for "Select Graphic Symbol Type(s)" and "Select Graphic Variable Types". A purple circle with the number 5 is positioned above the "Select Graphic Symbol Type(s)" dropdown, and a purple circle with the number 6 is positioned above the "Select Graphic Variable Types" dropdown.
- Temporal Bar Graph Section:** This section displays a temporal bar graph titled "Temporal Bar Graph". The x-axis represents years from 1998 to 2017. The y-axis lists various categories. Bars are colored by category: blue for Computer, orange for Application, green for Robotics, red for Law, purple for Stem, pink for Algebraic Geometry, grey for Capacity, light blue for Web, teal for Smart, dark teal for Computing, light green for Making, medium green for Education, dark green for Building, and black for Big Data and Machine. A purple circle with the number 7 is positioned above the graph area.
