NIH HubMap Hackathon
Chance to Hack the Human Kidney

Hackathon organizers at the University of Pittsburgh and Children’s Hospital of Pittsburgh are putting out a call for researchers to collaborate and contribute to data analysis in the field of human kidney disease. The event is part of the Hubmap Project, a large-scale effort to create a comprehensive blueprint of the human genome.

"The ultimate goal is to create a comprehensive database of all human kidney diseases," said Dr. James Stone, a pediatric nephrologist at Children’s Hospital of Pittsburgh. "We believe this could help us better understand the causes of kidney disease and ultimately lead to new treatments."
