Building a Science Observatory: Data, Tools, and Maps

Katy Börner

Cyberinfrastructure for Network Science Center, Director Information Visualization Laboratory, Director School of Library and Information Science Indiana University, Bloomington, IN katy@indiana.edu

With special thanks to the members at the Cyberinfrastructure for Network Science Center, the NWB team, the Sci2 team, the EpiC team, and the VIVO Collaboration

published in Dec 2009 argues for a

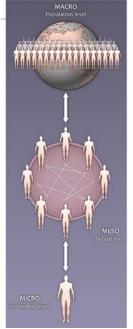

- A decentralized, free "Scholarly Database" to keep track, interlink, understand and improve the quality and coverage of Science and Technology (S&T) relevant data. (see also page 76 and 77 in Appendix D)
- A "Science Marketplace" that supports the sharing of expertise and resources and is fueled by the currency of science: scholarly reputation. (see page 74 in Appendix D) This marketplace might also be used by educators and the learning community to help bring science to the general public and out of the "ivory tower". (see page 89 in Appendix D)
- A "Science Observatory" that analyzes different datasets in real-time to assess the current state of S&T and to provide an outlook for their evolution under several (actionable) scenarios. (see page 72 in Appendix D)

- "Validate Science [of Science Results and] Maps" to understand and utilize their value for communicating science studies and models across scientific boundaries, but also to study and communicate the longitudinal (1980-today) impact of funding on the science system. (see page 81 in Appendix D)
- An easy to use, yet versatile, "Science Telescope" to communicate the structure and evolution of science to researchers, educators, industry, policy makers, and the general public at large. (see page 87 in Appendix D) The effect of this (and other science portals) on education and science perception needs to be studied in carefully controlled experiments. (see page 88 in Appendix D)
- Science of (Team) Science" studies are necessary to increase our understanding and support the formation of effective research and development teams. (see page 78 and 82 in Appendix D).
- "Success Criteria" need to be developed that support a scientific calculation of S&T benefits for society. (see also page 88 in Appendix D)
- A "Science Life" (an analog to Second Life) should be created to put the scientist's face on their science. Portals to this parallel world would be installed in universities, libraries and science museums. (see page 80 in Appendix D)

TEAM SCIENCE

A Multi-Level Systems Perspective for the Science of Team Science

Katy Börner,^{1*} Noshir Contractor,² Holly J. Falk-Krzesinski,³ Stephen M. Fiore,⁴ Kara L. Hall,⁵ Joann Keyton,⁶ Bonnie Spring,⁷ Daniel Stokols,⁸ William Trochim,⁹ Brian Uzzi¹⁰

Published 15 September 2010; Volume 2 Issue 49 49cm24

This Commentary describes recent research progress and professional developments in the study of scientific teamwork, an area of inquiry termed the "science of team science" (SciTS, pronounced "sahyts"). It proposes a systems perspective that incorporates a mixed-methods approach to SciTS that is commensurate with the conceptual, methodological, and translational complexities addressed within the SciTS field. The theoretically grounded and practically useful framework is intended to integrate existing and future lines of SciTS research to facilitate the field's evolution as it addresses key challenges spanning macro, meso, and micro levels of analysis.

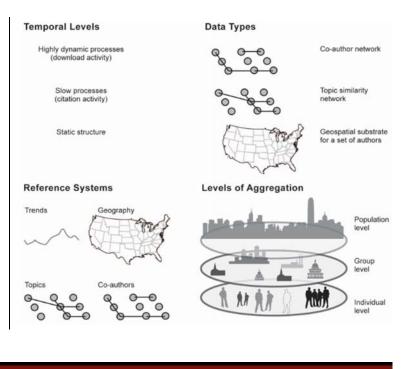

Science of (team) science research and practice requires an interdisciplinary, multi-level, mixed-methods approach.

6

Modeling Science Dynamics using

- multi-level,
- mixed methods, and
- multi-perspective models

Katy Börner, Kevin W. Boyack, Staša Milojević, Steven Morris. (2011) An introduction to modeling science: Basic model types, key definitions, and a general framework for the comparison of process models. In Scharnhorst, Andrea, Börner, van den Besselaar (Eds) Models of Science Dynamics. Springer Verlag.

Börner: Building a Science Observatory

Descriptive Models of Science

- Detect advances of scientific knowledge via "longitudinal mapping" (Garfield, 1994).
- Synthesis of specialty narratives from co-citation clusters (Small, 1986).
- Identify cross-disciplinary fertilization via "passages through science" (Small, 1999, 2000).
- Understand scholarly information foraging (Sandstrom, 2001).
- Knowledge discovery in un-connected terms (Swanson & Smalheiser, 1997).
- Determine areas of expertise for specific researcher, research group via "invisible colleges" (note that researchers self definition might differ from how field defines him/her) (Crane, 1972).
- Identify profiles of authors, also called CAMEOS, to be used to for document retrieval or to map an author's subject matter and studying his/her publishing career, or to map the social and intellectual networks evident in citations to and from authors and in co-authorships (White, 2001).

Descriptive Models of Science cont.

- Identification of scientific frontiers <u>http://www.science-frontiers.com/</u>.
- ISI's Essential Science Indicators <u>http://essentialscience.com/</u>
- Import-export studies (Stigler, 1994).
- Evaluation of 'big science' facilities using 'converging partial indicators' (Martin, 1996; Martin & Irvine, 1983).
- Input (levels of funding, expertise of scientists, facilities used) output (publications, patents, Nobel prices, improved health, reduced environment insults, etc. - influenced by political, economic, financial, and legal factors studies (Kostroff & DelRio, 2001).
- > Determine influence of funding on research output (Boyack & Borner, 2002).
- How to write highly influential paper (van Dalen & Henkens, 2001).

🔱 INDIANA UNIVERSITY

Börner: Building a Science Observatory

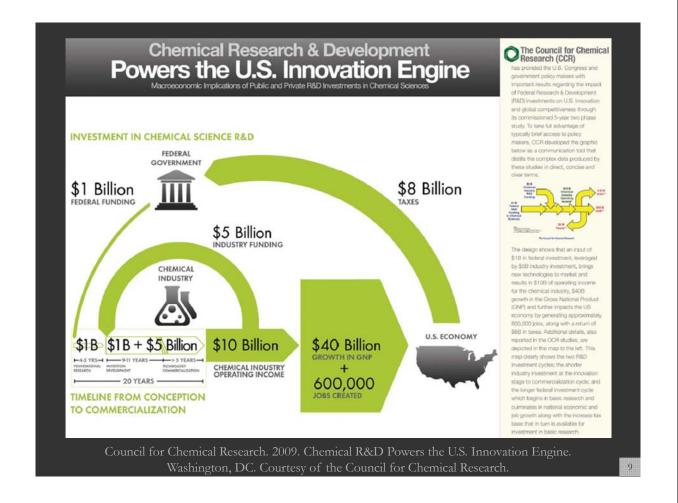

Process Models of Science

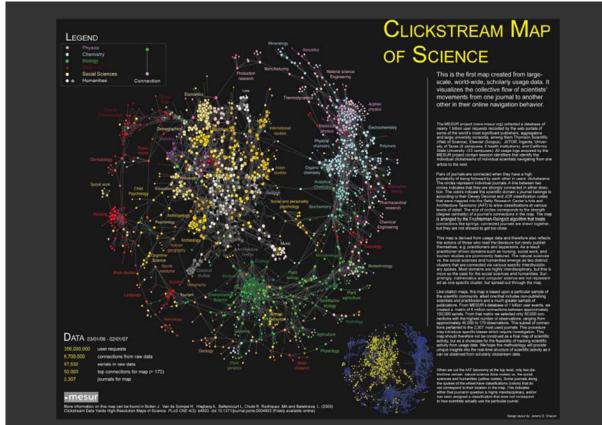

Can be used to predict the effects of

- Large collaborations vs. single author research on information diffusion.
- Different publishing mechanisms, e.g., E-journals vs. books on co-authorship, speed of publication, etc.
- Supporting disciplinary vs. interdisciplinary collaborations.
- Many small vs. one large grant on # publications, Ph.D. students, etc.
- Resource distribution on research output.
- ≻ ...

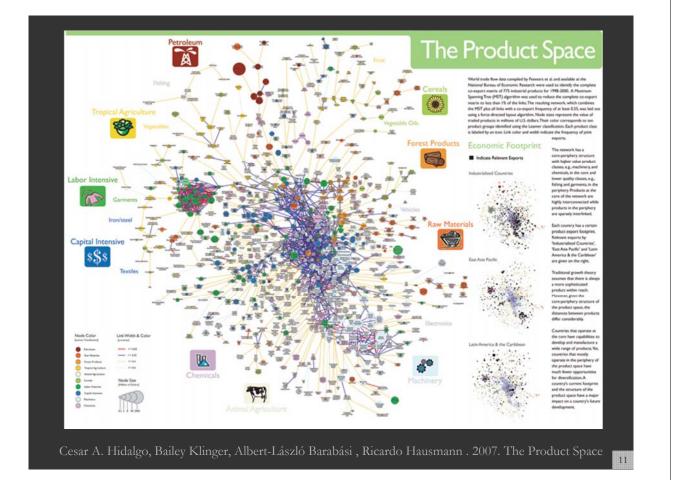

In general, process model provide a means to analyze the structure and dynamics of science -- to study science using the scientific methods of science as suggested by Derek J. deSolla Price about 40 years ago.

Global Projection of Subjective Well-being

Different Stakeholder Groups and Their Needs

Funding Agencies

Need to monitor (long-term) money flow and research developments, identify areas for future development, stimulate new research areas, evaluate funding strategies for different programs, decide on project durations, funding patterns.

Scholars

Want easy access to research results, relevant funding programs and their success rates, potential collaborators, competitors, related projects/publications (research push).

Industry

Is interested in fast and easy access to major results, experts, etc. Influences the direction of research by entering information on needed technologies (industry-pull).

Advantages for Publishers

Need easy to use interfaces to massive amounts of interlinked data. Need to communicate data provenance, quality, and context.

Society

> Needs easy access to scientific knowledge and expertise.

Börner: Building a Science Observatory

14

Scholars Have Different Roles/Needs

- **Researchers and Authors**—need to select promising research topics, students, collaborators, and publication venues to increase their reputation. They benefit from a global view of competencies, reputation and connectivity of scholars; hot and cold research topics and bursts of activity, and funding available per research area.
- **Editors**—have to determine editorial board members, assign papers to reviewers, and ultimately accept or reject papers. Editors need to know the position of their journals in the evolving world of science. They need to advertise their journals appropriately and attract high-quality submissions, which will in turn increase the journal's reputation and lead to higher quality submissions.
- **Reviewers**—read, critique, and suggest changes to help improve the quality of papers and funding proposals. They need to identify related works that should be cited or complementary skills that authors might consider when selecting project collaborators.
- **Teachers**—teach classes, train doctoral students, and supervise postdoctoral researchers. They need to identify key works, experts, and examples relevant to a topic area and teach them in the context of global science.
- **Inventors**—create intellectual property and obtain patents, thus needing to navigate and make sense of research spaces as well as intellectual property spaces.
- **Investigators**—scholars acquire funding to support students, hire staff, purchase equipment, or attend conferences. Here, research interests and proposals have to be matched with existing federal and commercial funding opportunities, possible industry collaborators and sponsors.
- **Team Leads and Science Administrators**—many scholars direct multiple research projects simultaneously. Some have full-time staff, research scientists, and technicians in their laboratories and centers. Leaders need to evaluate performance and provide references for current or previous members; report the progress of different projects to funding agencies.

access it at the perfect moment using, e.g., Facebook, LinkedIn, Academia, VIVO, Harvard Profiles, Elsevier's Collexis, Loki, Stanford's CAP, or other systems.

BUT: Also need access to research data, software, resources.

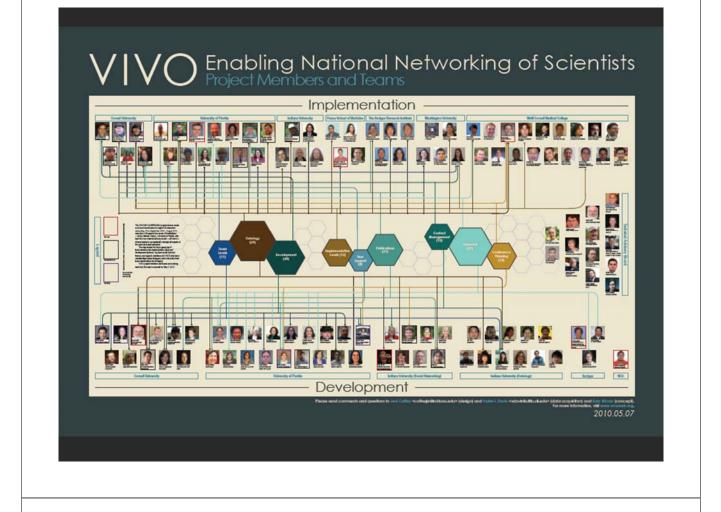

VIVO: A Semantic Approach to Creating a National Network of Researchers (http://vivoweb.org)

- Semantic web application and ontology editor originally developed at Cornell U.
- Integrates research and scholarship info from systems of record across institution(s).
- Facilitates research discovery and crossdisciplinary collaboration.
- Simplify reporting tasks, e.g., generate biosketch, department report.

Tools - <u>continuously</u> identify, learn,

advance, share code, e.g., via Plug-and-Play Macroscopes

Börner, Katy. (March 2011). Plug-and-Play Macroscopes. *Communications of the ACM*, 54(3), 60-69.

Video and paper are at <u>http://www.scivee.tv/node/27704</u>

Designing "Dream Tools"

Many of the best micro-, tele-, and macroscopes are designed by **scientists keen to observe and comprehend what no one has seen or understood before.** Galileo Galilei (1564–1642) recognized the potential of a spyglass for the study of the heavens, ground and polished his own lenses, and used the improved optical instruments to make discoveries like the moons of Jupiter, providing quantitative evidence for the Copernican theory.

Today, scientists repurpose, extend, and invent new hardware and software to

create **"macroscopes"** that may solve both local and global challenges.

Plug-and-play macroscopes **empower** me, my students, colleagues, and 100,000 others that downloaded them.

Macroscopes

Decision making in science, industry, and politics, as well as in daily life, requires that we make sense of data sets representing the structure and dynamics of complex systems. Analysis, navigation, and management of these continuously evolving data sets require a new kind of data-analysis and visualization tool we call a macroscope (from the Greek macros, or "great," and skopein, or "to observe") inspired by de Rosnay's futurist science writings.

Macroscopes provide a "vision of the whole," helping us "synthesize" the related elements and enabling us to detect patterns, trends, and outliers while granting access to myriad details. Rather than make things larger or smaller, macroscopes let us observe what is at once too great, slow, or complex for the human eye and mind to notice and comprehend.

Microscopes

Telescopes

Macroscopes

Macroscopes cont.

While microscopes and telescopes are physical instruments, macroscopes resemble continuously changing bundles of software

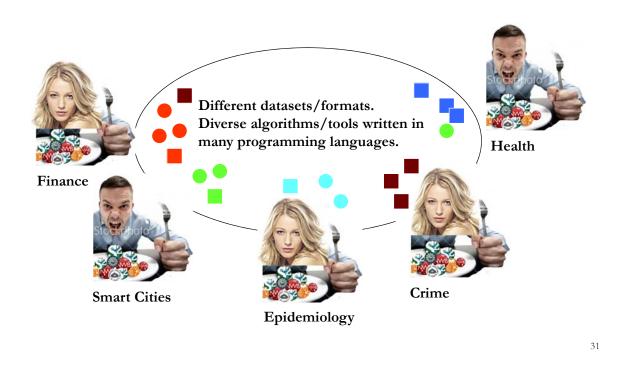

plug-ins. Macroscopes make it easy to select and combine algorithm and tool plug-ins but also interface plug-ins, workflow support, logging, scheduling, and other plug-ins needed for scientifically rigorous yet effective work.

They make it easy to share plug-ins via email, flash drives, or online. To use new plugins, simply copy the files into the plug-in directory, and they appear in the tool menu ready for use. No restart of the tool is necessary. Sharing algorithm components, tools, or novel interfaces becomes as easy as sharing images on Flickr or videos on YouTube. Assembling custom tools is as quick as compiling your custom music collection.

29

Macroscopes Serve the Changing Scientific Landscape

Related Work

Google Code and SourceForge.net provide special means for developing and distributing software

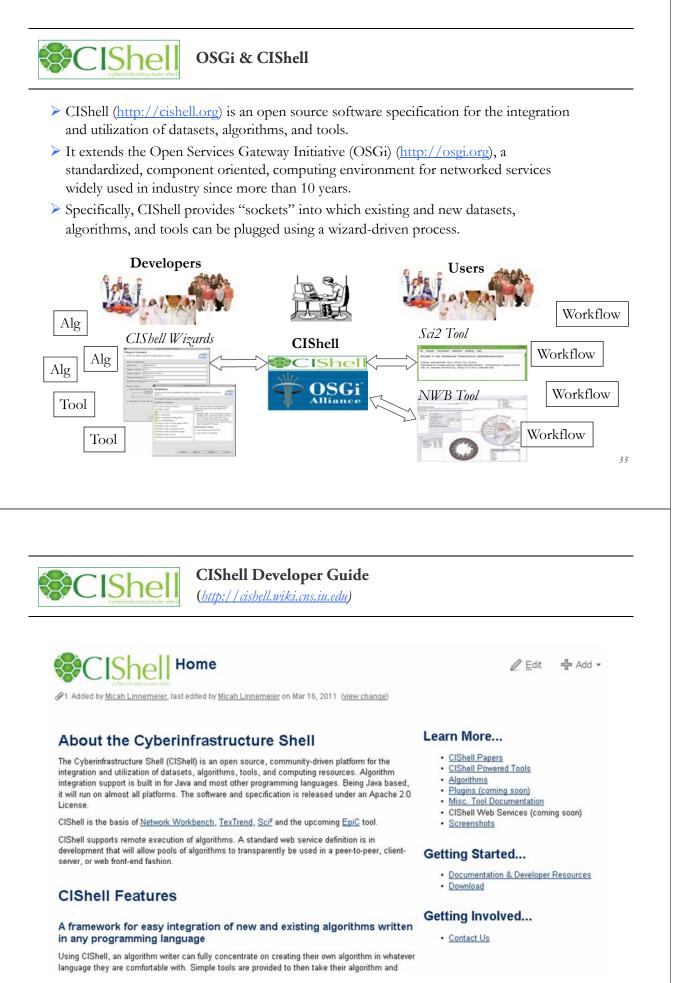

- In August 2009, SourceForge.net hosted more than 230,000 software projects by two million registered users (285,957 in January 2011);
- In August 2009 ProgrammableWeb.com hosted 1,366 application programming interfaces (APIs) and 4,092 mashups (2,699 APIs and 5,493 mashups in January 2011)

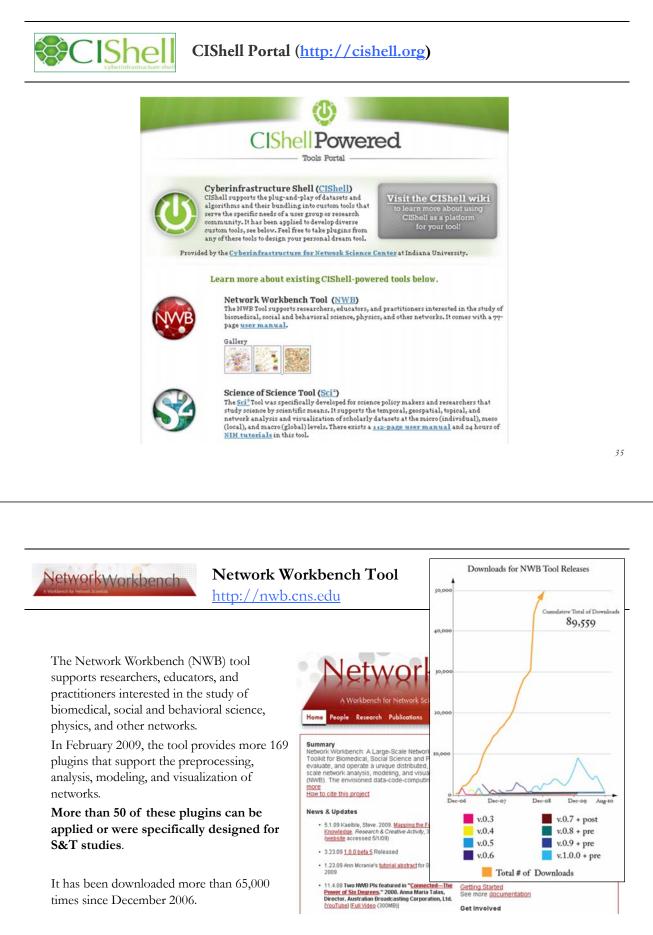

Cyberinfrastructures serving large biomedical communities

- Cancer Biomedical Informatics Grid (caBIG) (<u>http://cabig.nci.nih.gov</u>)
- Biomedical Informatics Research Network (BIRN) (<u>http://nbirn.net</u>)
- Informatics for Integrating Biology and the Bedside (i2b2) (<u>https://www.i2b2.org</u>)
- > HUBzero (<u>http://hubzero.org</u>) platform for scientific collaboration uses
- myExperiment (<u>http://myexperiment.org</u>) supports the sharing of scientific workflows and other research objects.

Missing so far is a **common standard** for

- the design of modular, compatible algorithm and tool plug-ins (also called "modules" or "components")
- > that can be easily combined into scientific workflows ("pipeline" or "composition"),
- > and packaged as **custom tools.**

OSGi/CIShell Adoption

A number of other projects recently adopted OSGi and/or CIShell:

- Cytoscape (<u>http://cytoscape.org</u>) Led by Trey Ideker at the University of California, San Diego is
- an open source bioinformatics software platform for visualizing molecular interaction
- networks and integrating these interactions with gene expression profiles and other state data (Shannon et al., 2002).
- MAEviz (<u>https://wiki.ncsa.uiuc.edu/display/MAE/Home</u>) Managed by Jong Lee at NCSA is an open-source, extensible software platform which supports seismic risk assessment based on the Mid-America Earthquake (MAE) Center research.
- Taverna Workbench (<u>http://taverna.org.uk</u>) Developed by the myGrid team (<u>http://mygrid.org.uk</u>) led by Carol Goble at the University of Manchester, U.K. is a free software tool for designing and executing workflows (Hull et al., 2006). Taverna allows users to integrate many different software tools, including over 30,000 web services.
- TEXTrand (http://tu.dwad.org) Led by Coorse Kampie et Fitterie Legis d University
- TEXTrend (<u>http://textrend.org</u>) Led by George Kampis at Eötvös Loránd University, Budapest, Hungary supports natural language processing (NLP), classification/mining, and graph designed as the analysis of busic and exactly the support of the support.
- algorithms for the analysis of business and governmental text corpuses with an inherently temporal component.
- DynaNets (<u>http://wmw.dynanets.org</u>) Coordinated by Peter M.A. Sloot at the University of Amsterdam, The Netherlands develops algorithms to study evolving networks.
- SISOB (<u>http://sisob.lcc.uma.es</u>) An Observatory for Science in Society Based in Social Models.

As the functionality of OSGi-based software frameworks improves and the number and diversity of dataset and algorithm plugins increases, the capabilities of custom tools will expand.

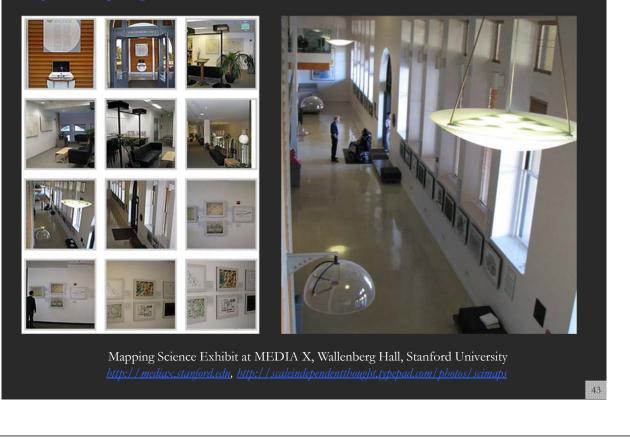

- effectively communicate the

structure and dynamics of science to different stakeholders using (interactive) visualizations.
