Edward R. Tufte

Envisioning Information

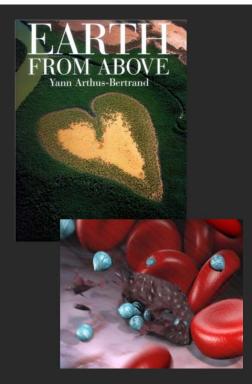

Edward R. Tufte

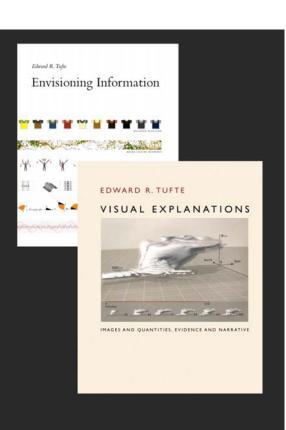

All three care deeply about

- 1. Data,
- 2. Existing expertise and insight needs, and
- 3. Are able to acquire the resources it takes to
- Spent months/years to deeply understand the problem/possible solutions.
- Render data optimally for the human perceptual-cognitive system – given our current understanding of human perception/cognition and technology.

The result are insightful yet perceptually stunning, intellectually stimulating, and emotion provoking imagery.

Photography, scientific visualization, animation— x-y-z positions exist.

Data visualization, data graphics— Mostly without x-y-z positions.

EDWARD R. TUFTE

VISUAL EXPLANATIONS

MAGES AND QUANTITIES, EVIDENCE AND NARRATIVE

Today's massive amounts of streaming <u>data cannot be</u> <u>rendered by hand</u>.

How can computers be used to render informative and visually pleasing visualizations that make a difference?

Need <u>BIG data analyses and</u> <u>visualizations</u> that conform to human <u>visual perception</u> and <u>cognitive processing</u>.

Needs-Driven Workflow Design using a modular data acquisition/analysis/ modeling/ visualization pipeline as well as modular visualization layers.

Type of Analysis vs. Level of Analysis

	Micro/Individual	Meso/Local	Macro/Global
	(1-100 records)	(101–10,000 records)	(10,000 < records)
Statistical Analysis/Profiling	Individual person and their expertise profiles	Larger labs, centers, universities, research domains, or states	All of NSF, all of USA, all of science.
Temporal Analysis	Funding portfolio of one individual	Mapping topic bursts	113 Years of Physics
(When)		in 20-years of PNAS	Research
Geospatial Analysis (Where)	Career trajectory of one individual	Mapping a states intellectual landscape	PNAS publications
Topical Analysis	Base knowledge from which one grant draws.	Knowledge flows in	VxOrd/Topic maps of
(What)		Chemistry research	NIH funding
Network Analysis (With Whom?)	NSF Co-PI network of one individual	Co-author network	NIH's core competency

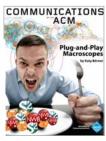

Overview

- **1. Motivation:** Design informative and visually pleasing visualizations that make a difference.
- 2. Theory: Learn from and combine approaches from psychology, cartography, computer science, information visualization, statistics, graphic design.
- 3. **Practice:** Sample <u>visualizations</u> designed for experts and a general audience + plug-and-play macroscope <u>tools</u> that commoditize data mining and visualization.

Different Stakeholder Groups and Their Needs

Funding Agencies

Need to monitor (long-term) money flow and research developments, identify areas for future development, stimulate new research areas, evaluate funding strategies for different programs, decide on project durations, funding patterns.

Scholars

Want easy access to research results, relevant funding programs and their success rates, potential collaborators, competitors, related projects/publications (research push).

Industry

Is interested in fast and easy access to major results, experts, etc. Influences the direction of research by entering information on needed technologies (*industry-pull*).

Advantages for Publishers

Need easy to use interfaces to massive amounts of interlinked data. Need to communicate data provenance, quality, and context.

Society

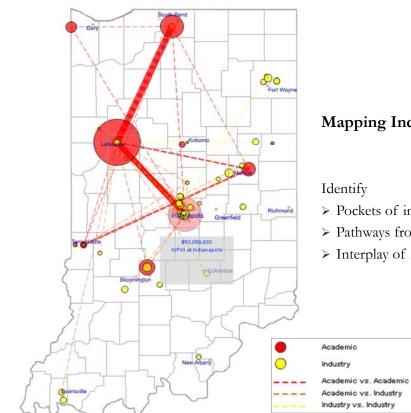

> Needs easy access to scientific knowledge and expertise.

Scholars Have Different Roles/Needs

- **Researchers and Authors**—need to select promising research topics, students, collaborators, and publication venues to increase their reputation. They benefit from a global view of competencies, reputation and connectivity of scholars; hot and cold research topics and bursts of activity, and funding available per research area.
- **Editors**—have to determine editorial board members, assign papers to reviewers, and ultimately accept or reject papers. Editors need to know the position of their journals in the evolving world of science. They need to advertise their journals appropriately and attract high-quality submissions, which will in turn increase the journal's reputation.
- **Reviewers**—read, critique, and suggest changes to help improve the quality of papers and funding proposals. They need to identify related works that should be cited or complementary skills that authors might consider when selecting project collaborators.
- **Teachers/Mentors**—teach classes, train doctoral students, and supervise postdoctoral researchers. They need to identify key works, experts, and examples relevant to a topic area and teach them in the context of global science.
- **Inventors**—create intellectual property and obtain patents, thus needing to navigate and make sense of research spaces as well as intellectual property spaces.
- **Investigators**—scholars need funding to support students, hire staff, purchase equipment, or attend conferences. Here, research interests and proposals have to be matched with existing federal and commercial funding opportunities, possible industry collaborators and sponsors.
- **Team Leads and Science Administrators**—many scholars direct multiple research projects simultaneously. Some have full-time staff, research scientists, and technicians in their laboratories and centers. Leaders need to evaluate performance and provide references for current or previous members; report the progress of different projects to funding agencies.

Science Maps in "Expedition Zukunft" science train visiting 62 cities in 7 months 12 coaches, 300 m long Opening was on April 23rd, 2009 by German Chancellor Merkel <u>http://www.expedition-zukunft.de</u>

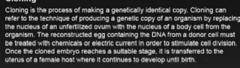

About

This Illuminated Diagram display adds the flexibility of an interactive program to the incredibly high data density of a print. This technique is generally useful when there is too much pertinent data to be displayed on a screen but the data is relatively stable. The computer can direct the eye to what's important by using projectors or screens as smart spotlights, animating the research impact of individuals, giving a "grand tour" of science, or highlighting query results (as when you touch the lectern or use the keyboard) with an overlay of moving light.

Cloning

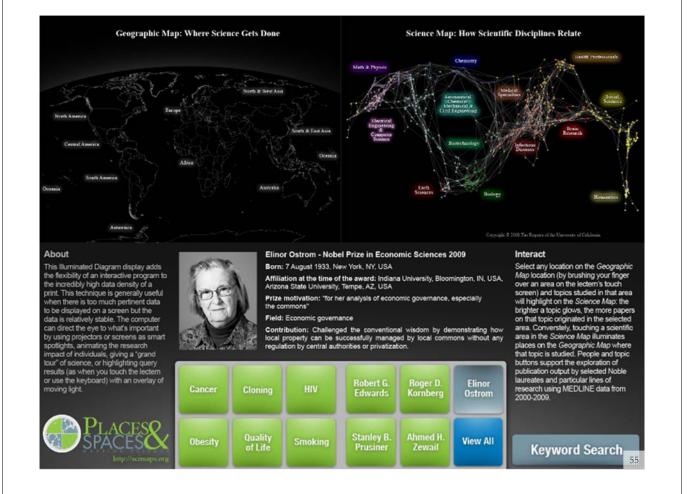

The first adult mammal cloned was Dolly the Sheep in 1997.

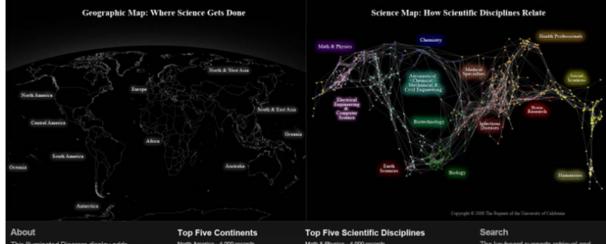

Interact

Select any location on the Geographic Map location (by brushing your finger over an area on the lectern's touch screen) and topics studied in that area will highlight on the Science Map: the brighter a topic glows, the more papers on that topic originated in the selected area. Converstely, touching a scientific area in the Science Map illuminates places on the Geographic Map where that topic is studied. People and topic buttors support the exploration of publication output by selected Noble laureates and particular lines of research using MEDLINE data from 2000-2009.

Keyword Search

This Illuminated Diagram display adds the flexibility of an interactive program to the incredibly high data density of a print. This technique is generally useful when there is too much pertinent data to be displayed on a screen but the data is relatively stable. The computer can direct the eye to what's important by using projectors or screens as smart spotlights, animating the research impact of individuals, giving a "grand tou" of science, or high tighting query results (as when you touch the lectern or use the keyboard) with an overlay of moving light.

The keyboard supports retrieval and display of papers based on their Medical Subject Headings (MeSH) and MeSH qualifier terms. If multiple terms are entered in a field, they are automatically combined using "OR". So, "breast cancer" matches any record with "breast" or "cancer" in that field. You can put AND between terms to combine with "AND". Thus "breast AND cancer" would only match records that contain both terms. Double quotation can be used to match compound terms, e.g., "breast cancer" retrieves records with the phrase "breast cancer", and not records where "breast cancer", and not records where "breast cancer cancer."

Designing "Dream Tools"

Many of the best micro-, tele-, and macroscopes are designed by **scientists keen to observe and comprehend what no one has seen or understood before.** Galileo Galilei (1564–1642) recognized the potential of a spyglass for the study of the heavens, ground and polished his own lenses, and used the improved optical instruments to make discoveries like the moons of Jupiter, providing quantitative evidence for the Copernican theory.

Today, scientists repurpose, extend, and invent new hardware and software to

create **"macroscopes"** that may solve both local and global challenges.

Plug-and-play macroscopes **empower** me, my students, colleagues, and 100,000 others that downloaded them.

Macroscopes

Decision making in science, industry, and politics, as well as in daily life, requires that we make sense of data sets representing the structure and dynamics of complex systems. Analysis, navigation, and management of these continuously evolving data sets require a new kind of data-analysis and visualization tool we call a macroscope (from the Greek macros, or "great," and skopein, or "to observe") inspired by de Rosnay's futurist science writings.

Macroscopes provide a "vision of the whole," helping us "synthesize" the related elements and enabling us to detect patterns, trends, and outliers while granting access to myriad details. Rather than make things larger or smaller, macroscopes let us observe what is at once too great, slow, or complex for the human eye and mind to notice and comprehend.

Microscopes

Telescopes

Macroscopes

Macroscopes cont.

While microscopes and telescopes are physical instruments, macroscopes resemble continuously changing bundles of software

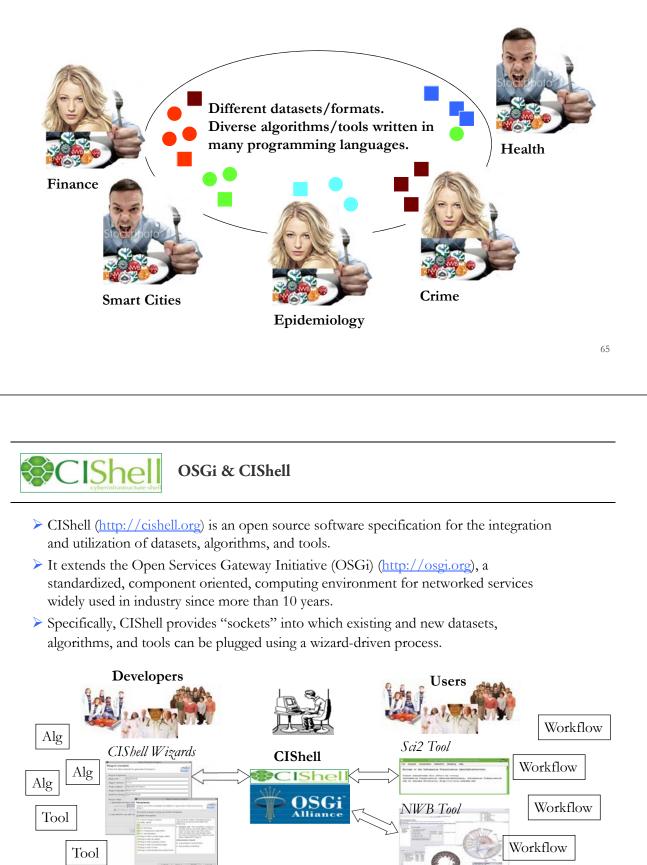

plug-ins. Macroscopes make it easy to select and combine algorithm and tool plug-ins but also interface plug-ins, workflow support, logging, scheduling, and other plug-ins needed for scientifically rigorous yet effective work.

They make it easy to share plug-ins via email, flash drives, or online. To use new plugins, simply copy the files into the plug-in directory, and they appear in the tool menu ready for use. No restart of the tool is necessary. Sharing algorithm components, tools, or novel interfaces becomes as easy as sharing images on Flickr or videos on YouTube. Assembling custom tools is as quick as compiling your custom music collection.

Macroscopes Serve International, Interdisciplinary Scholars

CIShell Developer Guide

(<u>http://cishell.wiki.cns.iu.edu</u>)

CIShell Home

@1 Added by Micah Linnemeier, last edited by Micah Linnemeier on Mar 16, 2011 (view change)

About the Cyberinfrastructure Shell

The Cyberinfrastructure Shell (CIShell) is an open source, community-driven platform for the integration and utilization of datasets, algorithms, tools, and computing resources. Algorithm integration support is built in for Java and most other programming languages. Being Java based, it will run on almost all platforms. The software and specification is released under an Apache 2.0 License.

CIShell is the basis of Network Workbench, TexTrend, Sci² and the upcoming EpiC tool.

CIShell supports remote execution of algorithms. A standard web service definition is in development that will allow pools of algorithms to transparently be used in a peer-to-peer, clientserver, or web front-end fashion.

CIShell Features

A framework for easy integration of new and existing algorithms written in any programming language

Using CIShell, an algorithm writer can fully concentrate on creating their own algorithm in whatever language they are comfortable with. Simple tools are provided to then take their algorithm and

NetworkWorkbench

Network Workbench Tool http://nwb.cns.edu

The Network Workbench (NWB) tool supports researchers, educators, and practitioners interested in the study of biomedical, social and behavioral science, physics, and other networks.

In February 2009, the tool provides more 169 plugins that support the preprocessing, analysis, modeling, and visualization of networks.

It has been downloaded more than 110,000 times since December 2006.

Computational Proteomics

What relationships exist between protein targets of all drugs and all disease-gene products in the human protein–protein interaction network?

Yildriim, Muhammed A., Kwan-II Goh, Michael E. Cusick, Albert-László Barabási, and Marc Vidal. (2007). Drug-target Network. Nature Biotechnology 25 no. 10: 1119-1126.

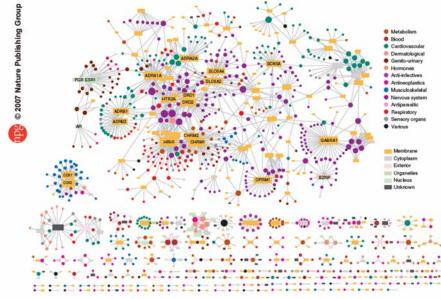

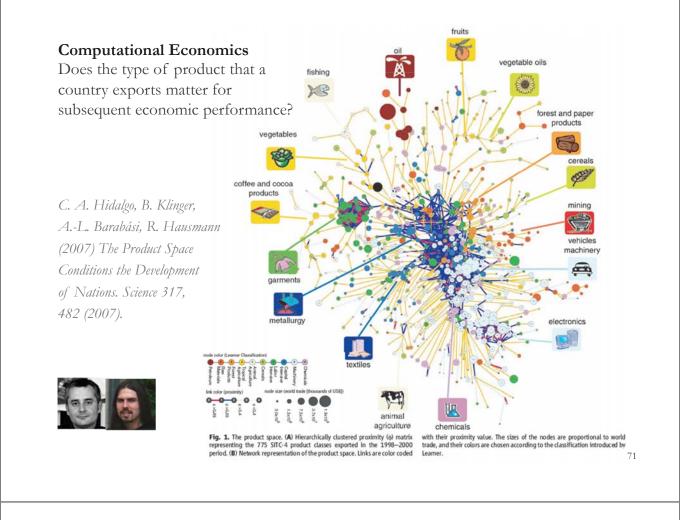

Figure 2 Drug-target network (DT network). The DT network is generated by using the known associations between FDA-approved drugs and their target proteins. Circles and rectangles correspond to drugs and target proteins, respectively. A link is placed between a drug node and a target node if the protein is a known target of that drug. The area of the drug (protein) node is proportional to the number of targets that the drug has (the number of drugs targeting the protein). Color codes are given in the legend. Drug nodes (circles) are colored according to their Anatomical Therapeutic Chemical Classification, and the target proteins (rectangular boxes) are colored according to their cellular component obtained from the Gene Ontology database.
