Visualizing the Topic Space of the United States Supreme Court

Abstract

This article describes the creation of several domain maps based on the topic space of opinions issued by the United States Supreme Court. Topics assigned by West Publishing were harvested off of the Westlaw database and visualized using Principle Components Analysis (PCA), Multidimensional Scaling (MDS), and graph visualization software (Pajek). Peculiar topic adjacencies were noted and attributed to the unique nature of cases argued at the level of the United States Supreme Court. The work is contextualized throughout by the author's desire to create a rigorous base map on which to layer additional data for teaching purposes.

Keywords

Domain Maps; Visualizations; United States Supreme Court; Law; Political Science; Westlaw

Introduction

Background and Purpose

This research seeks to identify the topical adjacencies of subjects addressed in legal cases by the United States Supreme Court based on the co-occurrence of top level topics assigned by West Publishing (Thomson/West, 2006). It is in furtherance of the author's goal of creating a rigorous substrate map on which to layer over sixty years of Supreme Court topic data to be used for teaching purposes. In addition, the research is related to a growing body of work detailing and analyzing the network structure of legal opinions and their citation linkages (Chandler, 2005; Cross & Smith, In Press; Cross, Smith & Tomarchio, In Press; Fowler et. al., In Press; Smith, In Press), judicial and legislative co-voting networks (Fowler, 2006; Poole, 2005; Porter et. al., 2005), and the move in legal academia toward quantitative empirical scholarship (George, 2006).

Maps of inherently non-spatial data that use a spatial substrate on which to layer additional information are common in information science (Hook & Börner, 2005). These maps employ the distance-similarity metaphor by which the viewer infers that items more proximate in space are more related than items further apart (Montello et al., 2003; Skupin and Fabrikant, 2003). The benefit of a substrate map is that it provides a common background from which changes may be readily perceived and is thus useful for pedagogy and illustrating changes over time.

Spatial layouts of inherently non-spatial data may be created in several ways. The first way is by the opinion of experts as to which topics are most similar and by laying out those topics by intuitive warrant or heuristics (*See* Bernal, 1939; Ellingham, 1948). The second way is by algorithmic comparisons of similarity and automated layouts using objective measures such as citation linkages or the co-occurrence of terms (Börner, Chen, & Boyack, 2002). Finally, a third method is a fusion approach which combines elements of each of the first two methods. For the most part, this paper employs multivariate statistical techniques that fall into the second category. These techniques are principle component analysis ("PCA") and multidimensional scaling ("MDS"). However, elements of the fusion approach were used when the author placed data elements into higher level categories based on his training in and experience of the United States legal system before employing the multivariate statistical techniques.

Methods, Materials, Procedures, and Equipment Used

Data Summary

The dataset used for this research consists of bibliographic information about all United States Supreme Court cases that have been issued West topics by West Publishing from the 1944 term through the end of the 2004 term (October 1944 through July 2005). The author harvested the data as an academic end user from the Westlaw database. The data contains information about 7,948 unique Supreme Court cases to which 19,789 topic assignments have been made. Of the 405 top level topics in the West taxonomy, 290 appear in opinions issued by the Supreme Court for this time period. All but one (“Reference”), co-occur with other topics resulting in 22,345 edges between cases sharing a similar topic. There are 3743 unique topic pairings.

About the Data

For over a hundred years, West Publishing has identified unique statements of law within court cases. Human editors working at West assign these unique and legally controlling statements topic identifiers from its taxonomy of the law known as the West Topic and Key Number System (Doyle, 1992; Snyder, 1999; Thomson/West, 2006). Before the advent of online full-text searching, the West Topic and Key Number System was one of the only ways to research cases on a given issue. Now, the Topic and Key Number System is used primarily to augment free text searching and to convince a researcher that he or she has found all of the appropriate cases on a particular topic.

The Westlaw Database, owned by Thomson/West Publishing, provides online access to United States Supreme Court opinions, numerous other cases, and additional legal material. It is a proprietary subscription database used by lawyers, academics, journalists, law students, and information professionals. The database includes both the actual language of court opinions plus editorial enhancements provided by West such as topic assignments from the West Topic and Key Number System.

Data Harvesting

The data was harvested off of the Westlaw database during March through April, 2004. As of March 18, 2004, there were 405 top level topics in the West Topic and Key Number System. See **Appendix A**. A search as to each of the 405 topics was conducted by hand using the conventional end user interface. A typical search statement was: TO("2 Abatement and Revival"). The TO in this case means topic and the scope of the database at the time included all Supreme Court opinions from the 1944 term to date. The resultant list of cases for each of the 405 topic searches were placed into a spreadsheet along with the topic that caused the case to be returned by the database. Topic assignments were aggregated such that each case was listed with all of its topic assignments and did not appear more than once. Subsequent Supreme Court cases and their topic assignments were added later. See **Appendix B** for a listing of the frequencies of each of the 290 topics appearing in Supreme Court opinions from the 1994 term through the 2004 term.

Data Complication

Annually, West makes changes to its taxonomy. In order for the dataset to include cases after the original March through April 2004 harvesting period, new topics were converted to their previous equivalents to bring the dataset current through the end of July 2005. See **Appendix C** for a listing of these changes and how they were handled.

Additional Human Coding of the Data

Additionally, the author employed his legal training and knowledge of how concepts are taught in law school to make additional subject matter assignments to the 405 West topics: (1) Doctrinal – relevant to a specific subject taught in law school. (Constitutional Law, Administrative Law), (2) Factual – with unique factual circumstances relating to the topic but whose doctrinal elements are drawn from other topics (Aviation Law, Automobile Law), and (3) Procedural – capable of arising in almost any factual or doctrinal situation (Federal Courts, Federal Civil Procedure). For the doctrinal and procedural topics, the author also assigned categories to the topics based on in what course they are most likely to be covered in law school. **See Appendix D** for these additional category assignments.

Data Manipulation and Visualization

The data was imported to the R statistical computing environment. Before applying the multivariate statistical visualization techniques, the data had to be put into matrix form. The data comprises a sparse matrix of 3743 unique topic pairings out of a theoretically possible 83,521 (289 x 289). The range of topic co-occurrence counts is 1 to 896 (with Constitutional Law and Federal Courts (896) being the most common co-occurring topics and Constitutional Law and Criminal Law (468) being the second most common). The mean topic co-occurrence count was only 5.97 and the median and mode were both 1.

Both PCA and MDS were performed on the data. PCA was performed using Singular Value Decomposition (SVD). The resultant plots were useful to characterize the major dimensions in the variation in the data of topic co-occurrence. (See generally Paolillo and Wright, 2006). Additionally, the dataset was visualized in its network form using the network visualization and analysis tool, Pajek (Batagelj & Mrvar, 1998). In the parlance of network science, the nodes represented West Topics and the edges represented co-occurrence of those topics in Supreme Court cases.

Findings, Discussion and Conclusions

Network Graph Approach

Initial network based attempts to create a domain map of the topic space of Supreme Court cases using the spring force layout algorithm in Pajek proved unsatisfying. The procedural and factual topics, which may co-occur with just about any doctrinal topic, pulled everything to the center of the graph. In order to derive any insight using this approach, the author had to visualize just the doctrinal topics. Furthermore, to obtain readable visualizations, all of the co-occurrences were aggregated up from the West Topic level to the law school subject level (the course offered in law school most likely to teach that particular topic). The graph was then subjected to another double treatment. First, the most tenuous (least numerous) co-occurrences between subjects were discarded. This was a bit subjective and was again informed by the author's familiarity with legal topics. It was necessary because almost every subject co-occurred with Constitutional Law and a few other similarly ubiquitous topics. Second, amongst the remaining subjects, the graph was thresholded at 10 or more case co-occurrences between the subjects. This resulted in network visualization pictured in **Figure 1**.

Apparent from the visualization were several counterintuitive adjacencies that reflect the unique jurisdiction of the United States Supreme Court. Maritime cases invoke federal jurisdiction. Furthermore, to the extent that maritime cases involve contract disputes or workers' compensation claims, these issues are heard by the Federal Courts. Outside of the context of maritime law, contracts and workers' compensation cases are state court issues not typically heard by the Federal Courts and thus the Supreme Court. Thus, the resultant base map reflects an

inherent bias in the dataset. No expert in the law would intuitively co-locate Maritime Law, Workers' Compensation, and Contracts outside the unique context of cases being heard in the Supreme Court.

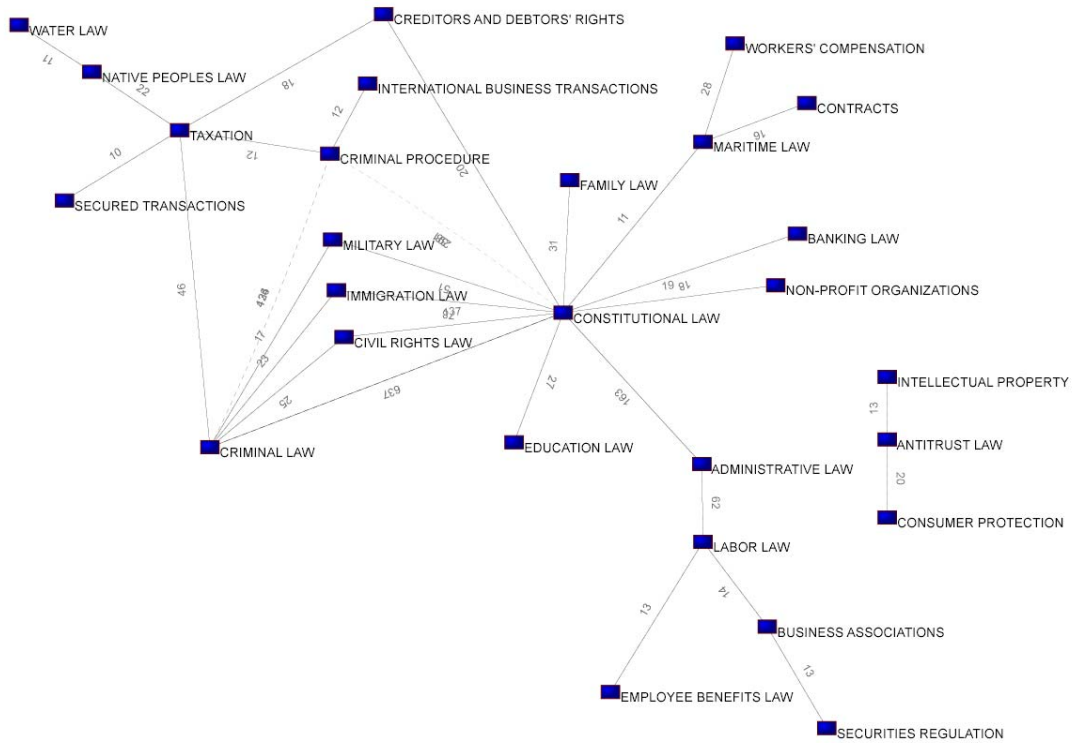

Figure 1: West Topic Space of the United States Supreme Court—Network Layout

PCA Approach

A plot of the amount of the variance contained in each of the singular values reveals that the first twenty-five dimensions account for almost 4/5ths of the variance. On the whole, the dimensionality plots do not reveal easily identifiable continuums. However, the plot of the 1st and 2nd principle components reveal a readily identifiable continuum between criminal matters on one end (Receiving Stolen Goods, Rape, Robbery, Larceny, Homicide, etc.), and business matters on the other (Quieting Title, Constructive Contracts, Mortgages, etc.). This division between matters of life and limb and those of property nicely corresponds with the popular perception of the justice system as being composed largely of two parts—criminal and non-criminal matters. **See Figures 2.** This same continuum may also be seen in a non-PCA layout of the topic relationships of one particular Supreme Court term (2004) created by the author. Cases as nodes are linked to the topics they contain which are also portrayed as nodes. The spatial layout was generated by hand employing nothing more than the heuristic charge to minimize edge crossings. The same criminal/business continuum is also apparent. **See Figure 3.**

Business Matters (Property)

Criminal Matters (Life & Limb)

Figure 2: PCA (2nd and 1st Dimensions)

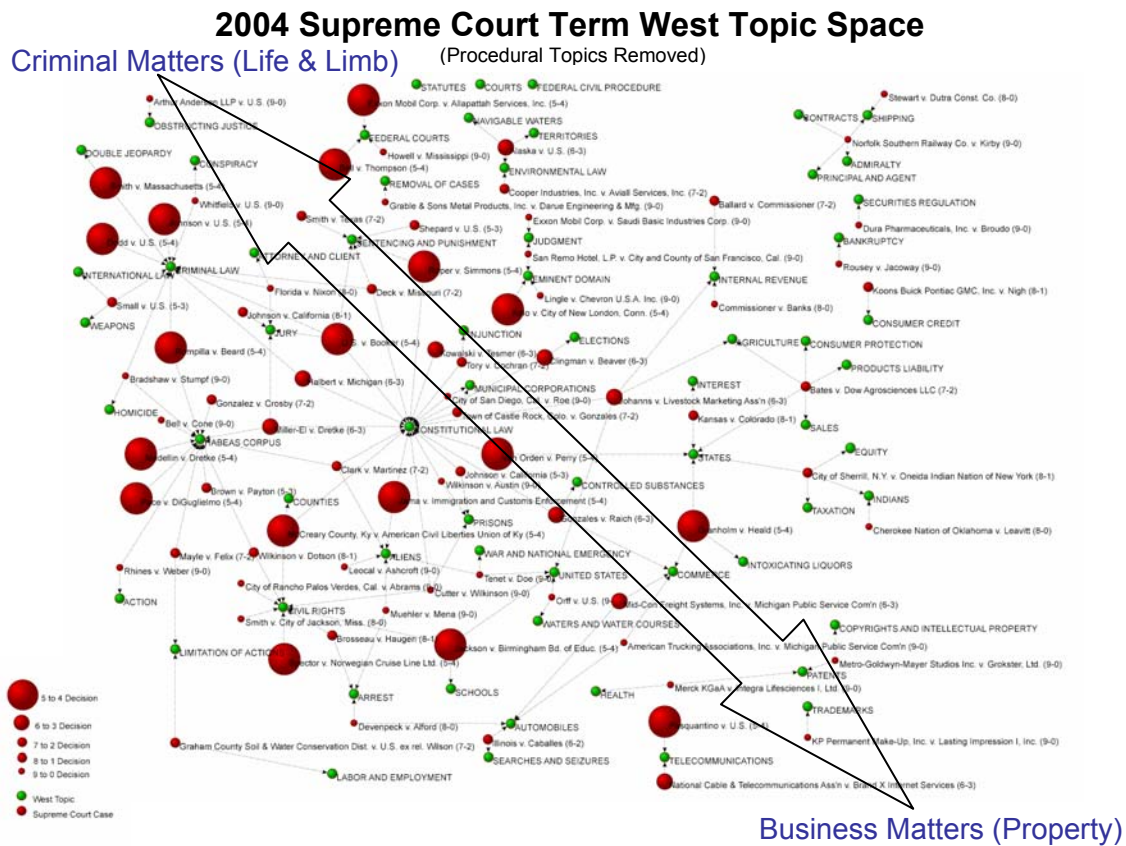

Figure 3: Non PCA Layout of Topics and Cases

The layout of topics of the first two principle components revealed topic adjacencies that are contrary to traditional categorizations, but upon further reflection make sense. For instance, the topic Bigamy, which is a crime, appears on the Business Matters end of the previously identified continuum. This at first appears to be an error. However, further research reveals that the topic Bigamy appears only once in the entire dataset. It occurs in the context of a divorce case in which alimony and the division of marital property were hotly contested. In fact, the alleged bigamy (one spouse got a divorce and remarried in a different state and these actions were not recognized by the original state) was the means to the end of acquiring more marital assets in the divorce proceeding. Thus, the appearance of the topic Bigamy at the Business/Property side of the continuum makes sense even though it is contrary to how a law student would encounter the topic. See Figure 4.

Figure 4: Placement of the Topic Bigamy

As explained above, the author assigned the West Topics one of three additional labels—doctrinal, procedural and factual. The impetus for this was the fact that when the topic space was rendered using only a node link approach coupled with a spring force algorithm, many of the procedural and factual topics, which may co-occur with just about any doctrinal topic, pull everything to the center of the graph. Fortunately, this appears to be less of a problem using the PCA approach. Interestingly, the layout of the fifth and sixth principle components bears out a separation of the doctrinal (red) and procedural topics (blue) with the factual topics (green) clustered in between the two. See Figure 5.

Figure 5: PCA (5th and 6th Dimensions)

Furthermore, the layout of the seventh and eighth principle components reveals a continuum between family obligations (Bigamy, Marriage, Estates in Property, Divorce, Homestead, Husband & Wife, etc.) and business obligations (Subrogation, Mechanics Liens, Principal/Surety, Assignments, Payment, etc.). See Figure 6. There were no additional continuums in the remaining first twenty-five principle components that the author could identify.

Figure 6: PCA (7th and 8th Dimensions)

PCA Just Doctrinal

As the author’s ultimate goal is to create a substrate map based on the layout of topics for use in legal education, he decided to conduct PCA with just the doctrinal topics. To this end, he aggregated the co-occurrence counts up from the West Topic level to the law school subject categories he assigned the doctrinal topics. These additional category assignments are based on where the topic would most likely be encountered in a law school course. The plots of the various dimensions produced adjacencies that were for the most part expected. See Figure 7. The upper left quadrant of the plot nicely co-locates various aspects of the law that deal with land in general (Public Land Law, Water Law, Environmental Law, Oil & Gas Law, Property Law, Native Peoples Law, and Taxation.) The later two course topics most likely cluster in this region because the underlying events that resulted in the cases to which these topics are assigned most likely involved land. Presumably, most of the taxation cases that reach the Supreme Court involve property taxes. Similarly, it is presumed from the PCA analysis that cases assigned the topics involving native peoples most likely also deal with land controversies.

It is similarly consistent with expectations that Criminal Law and Criminal Procedure appear adjacent to one another. These subjects, along with Constitutional Law, are inextricably linked. It is also appropriate that Estate Planning and Wills and Trust are proximate to one another. Taxation would be another subject that the author would expect to cluster closely with Estate Planning and Wills and Trusts. However, as mentioned previously, it is adjacent to topics involving land. It is similarly appropriate that Torts and Products Liability are in the same quadrant. The later is a subset of the former. Likewise, it is satisfying to one’s intuition that Juvenile Justice and Education Law are proximate as both involve children.

Figure 8: PCA, Doctrinal Subjects Aggregated to Law School Course Offerings

MDS

As the dataset could easily be converted from a matrix of counts, to a matrix of distances, multidimensional scaling (“MDS”) was utilized and to compare the results with those obtained from PCA. Co-occurrence counts were subtracted from the maximum number of co-occurrences (896) to get a measure of the distance between topics. The results were not as satisfactory as those produced by PCA. While some topic adjacencies made sense ((Searches and Seizures, Sentencing and Punishment, Habeas Corpus) and (Admiralty, Shipping, Seaman) most topics were clustered in an unreadable blob at the center of the plot. Similarly, the just doctrinal plots were also less intuitively satisfactory to one trained in the law as were those produced by PCA. See **Figure 8**.

Figure 8: MDS Just Doctrinal (7th & 8th Dimensions)

CONCLUSION

The multivariate statistical techniques employed in this paper contributed some to the author’s ultimate goal of a rigorous topic space substrate map of Supreme Court topics. The techniques reaffirmed the author’s intuitive understanding that the primary divide is between business and criminal matters. While the techniques were helpful in suggesting layouts of the super groupings, it will take a fusion approach to produce a substrate map that resonates with how legal topics are conceptualized, bundled, and taught in law school.

Part of the problem is that the approach might be faulty in part. As demonstrated by the ‘Bigamy’ example, the co-occurrence of topics in cases suggests relationships between topics that though logical, are not how a law student is presented the material. Additionally, part of the problem might also be the need to do the same analysis at an increased level of granularity. While there are only 405 top level West topics, there are about 100,000 sub-topic assignments. The same techniques involving the relationships of all of these sub-topic assignments might produce more intuitively satisfying maps. Also, the fact that the data is only from Supreme Court cases skews the results. Topic co-occurrence data is needed from the two additional levels of Federal Courts and all of the state case material as well. This will require a partnership with the actual database owner to obtain backend access.

Appendix C – MODIFICATIONS
(Resulting from Changes to the West Topic and Key Number System)

The data was original harvested off of Westlaw in March – April 2004.

Between March 18, 2004 and June 10, 2004, the following changes were made to the top level topics:

NEW TOPICS:

231H Labor and Employment
241E Limited Liability Companies

DISCONTINUED:

148A Employer's Liability (Now Contained in Labor and Employment)
232A Labor Relations (Now Contained in Labor and Employment)
255 Master and Servant (Now Contained in Principal and Agent)

RENUMBERED:

Kidnapping (232 to 231E)

Changes:

Three cases harvested after the initial search period had one of the new topics (231H, Labor and Employment):

Aetna Health Inc. v. Davila, 124 S.Ct. 2488 (6/21/2004)
Central Laborers' Pension Fund v. Heinz, 124 S.Ct. 2230 (6/7/2004)
Graham County Soil & Water Conservation Dist. v. U.S. ex rel. Wilson, 125 S.Ct. 2444
(6/20/2005)

As to the first two cases, the author assigned them the old West Topic, 296 Pensions, based on what they would have been as indicated by West.

As to the third case, the authored assigned this 232A Labor Relations.

2004-2005 Changes

NEW TOPICS:

315T Public Amusement and Entertainment (No Appearances in 2004 term)
382T Trademarks
392T Unemployment Compensation (No Appearances in the 2004 Term)

DISCONTINUED:

376 THEATERS AND SHOWS

RENUMBERED:

Prostitution (316 to 315H) (No Appearances in the 2004 term)

One Case was assigned 382T, Trademarks:

KP Permanent Make-Up, Inc. v. Lasting Impression I, Inc., 125 S.Ct. 542 (12/8/2004)

It was listed formally as, 382k375.1 (Trade Regulation). Consequently, the author changed it to this top level topic for purposes of the dataset.
